

Proclamation 2024: Report of Editorial Changes

This is a report of publishers' proposed changes resulting from an editorial review conducted after the pre-adoption samples were submitted. This report contains the publishers' proposed changes resulting from an editorial review conducted after submitting preadoption samples.

Publisher: Discovery Education Inc

Science, Grade K

Program: *Science Techbook for Texas by Discovery Education - Grade K: TEKS*

Component: *Science Techbook for Texas by Discovery Education: Grade K*

ISBN: 9781616291426

Current Page Number(s): <https://app.discoveryeducation.com/learn/player/b63ea212-735d-46a6-afdc-e74c17dfa699>

Location: Unit 1 > Concept 3 > Lesson 1 > Educator Notes > Real-World Phenomenon > Slide 7 > Preparation > bulleted list

Original Text: • Help students cover their flower designs with the second sheet of cling film when they are done.

Updated Text: • Help students cover their flower designs with the second sheet of cling film when they are done.

• Note: Clear tape is not needed for each group. It is used by the teacher to tape the film to the paper.

Component: *Science Techbook for Texas by Discovery Education: Grade K Unit 1 Teacher Edition*

ISBN: 9781616291525

Current Page Number(s): xxii

Location: Advance Prep, 3rd paragraph

Original Text: To prepare the flower shapes and cling film for students, line up one edge of a Flower Shape printout with the smooth side of the cling film against the printout. Tape the two together using clear tape. Trim the cling film to the same width as the other side of the printout, and tape this side together using clear tape.

Updated Text: To prepare the flower shapes and cling film for students, line up one edge of a Flower Shape printout with the smooth side of the cling film against the printout. Tape the two together using clear tape. Trim the cling film to the same width as the other side of the printout, and tape this side together using clear tape. Note: Clear tape is not needed for each group. It is used by the teacher to tape the film to the paper.

Component: *Science Techbook for Texas by Discovery Education: Grade K Unit 3 Teacher Edition*

ISBN: 9781616291563

Current Page Number(s): 58

Location: Using the Interactive, first paragraph

Original Text: Before beginning the interactive, go over the graphic organizer with students. Throughout the interactive, students will create scenes that show the weather and environment. Each image will show how a tree and its inhabitants change during the year. Prompt students to decorate each tree to match the tree in the interactive. If time permits, encourage them to add additional details to the images. Throughout the interactive work time, ask the following questions.

Updated Text: Guide students as they explore the interactive by spinning the wheel and then dragging images that portray the months, weather, nature, and clothing for each season. Students will create seasonal scenes that show the weather and environment. Each image will show how a tree and its inhabitants change during the year. Throughout the interactive work time, ask the following questions.

Current Page Number(s): 56

Location: What Did You Figure Out?, pencil box, anno

Original Text: Students should circle the image labeled Loam, medium water.

Updated Text: Students should circle the image labeled Loam, plenty of water.

Component: *Science Techbook for Texas by Discovery Education: Grade K Unit 2 Teacher Edition*

ISBN: 9781616291549

Current Page Number(s): 58

Location: ASK questions, third bullet text

Original Text: How might someone use rocks to keep people safe near water? Student responses will vary. Sample response: Someone could use rocks as a way to block people from walking too close to the water and falling in. Walkways near water can be made of smooth, hard materials such as concrete to allow wheelchair access and to prevent those walking from tripping and falling.

Updated Text: How might someone use rocks to keep people safe near water? Let's draw a model! Student responses will vary. Sample response: Students may draw a model of someone using rocks to build a wall as a way to block people from walking too close to the water and falling in. Students may draw walkways near water to be made of smooth, hard materials such as concrete to allow wheelchair access and to prevent those walking from tripping and falling.

Current Page Number(s): 57

Location: Differentiation box, paragraph text

Original Text: If students struggle with identifying the stages of the lima bean life cycle, have them consider different phases of their own lives and how they have grown and changed. Then, post and display images of the different stages of a lima bean's life cycle. Work with students to put them in order. Students should understand that lima beans begin as seeds, grow to seedlings and eventually adults, and then produce seeds so the cycle can start over. Make the connection to their lives by stating that both people and lima beans start small and grow.

Updated Text: If students struggle with identifying the stages of the lima bean life cycle, have them consider different phases of their own lives and how they have grown and changed. Then, post and display images of the different stages of a lima bean's life cycle. Work with students to put them in order. Students should understand that lima beans begin as seeds, grow to seedlings and eventually adults, and then produce seeds so the cycle can start over. Make the connection to their lives by stating that both people and lima beans start small and grow. Consider allowing students to use a signal such as a hand gesture when they do not understand spoken language during classroom instruction or interactions.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 21 of 3538

Original Text: Objective: Students explore and identify objects that are attracted to magnets. Students will analyze data by identifying any significant patterns found in objects attracted to a magnet

Updated Text: Background Information

Some objects are attracted to a magnet, and some are not. If an object is magnetic, it is made of materials that contain special properties called magnetism. These materials are called magnetic materials. Examples of magnetic materials include iron, nickel, and cobalt. Note: Aluminum is not magnetic even though it is a metal. Most metals are actually not magnetic. Iron is magnetic, and iron is in many, many objects.

Placing a magnet near an object is a factor or condition that can cause objects to either change or stay the same. In other words, sometimes the effect is a change, and sometimes the effect is no change at all. When a magnet is placed near an object, the object will respond by either moving toward the

magnet, away from the magnet, or it will not move at all. When conditions change, such as moving the magnet further away from objects, the response can still be either moving toward the magnet, away

from the magnet, or not moving at all. However, the objects might not be in the same category. For example, if a paper clip moved toward the magnet when the magnet was close, it might respond differently when the magnet is farther away, such as not moving at all.

As students investigate, encourage them to find and describe if conditions change how magnetic objects respond to a magnet.

Objective: Students explore and identify objects that are attracted to magnets. Students will analyze data by identifying any significant patterns found in objects attracted to a magnet and factors that affect change in the motion of some objects.

You will use your rock candy to create a prototype of your playground and discover any problems your design may have so they can be solved. • Role: You are an engineer, and your team is trying to solve the problem of building playground equipment with a new material- colored rocks! • Audience: Your target audience is the teachers and principals at your school. • Situation: The challenge is to create a new piece of playground equipment made from colored rocks that will be safe, fun, and easy to build. • Product: Your goal is to plan out and create a drawing that illustrates your design of playground equipment, and the final model using your colored rocks. It needs to specify how many colored rocks are needed. You should also be able to communicate any problems you had during design and how you solved them before completing the final model. • Success Criteria: You will be successful if your playground equipment is easy to build with colored rocks and fun for your fellow students to play on!

Updated Text: Goal: Your task is to create a piece of playground equipment for your school that accommodates children who cannot walk. You will design and build using the new colored rocks. You will use your rock candy to create a prototype of your playground and discover any problems your design may have so they can be solved.

- Role: You are an engineer, and your team is trying to solve the problem of building playground equipment with a new material- colored rocks!
- Audience: Your target audience is the teachers and principals at your school.
- Situation: The challenge is to create a new piece of playground equipment made from colored rocks that will be safe, fun, and easy to build.
- Product: Your goal is to plan out and create a drawing that illustrates your design of playground equipment, and the final model using your colored rocks. It needs to specify how many colored rocks are needed. You should also be able to communicate any problems you had during design and how you solved them before completing the final model.
- Success Criteria: You will be successful if your playground equipment is easy to build with colored rocks and fun for ALL of your fellow students to play on!

Location: Topic 1 Overview, Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about how different objects can be classified. First, in Experience 1, they will identify observable physical properties of objects, including shape, color, texture, and material. Then, in Experience 2, they will generate ways to classify objects based on physical properties.

Preview the Phenomenon

Students watch and respond to a short Anchoring Phenomenon Video that shows a variety of small objects scattered on a table. As students progress through the two experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How can we organize these things?

Updated Text: Preview the Topic

In this topic, students learn about how different objects can be classified. First, in Experience 1, they will identify observable physical properties of objects, including shape, color, texture, and material. Then, in Experience 2, they will generate ways to classify objects based on physical properties.

As you progress through the topic, connect the activities back to Pre-K Theme 1-Hello School! Students can apply what they learned in Theme 1 about the describing the color, size, and shape of common objects (PK.VI.A.1).

Preview the Phenomenon

Students watch and respond to a short Anchoring Phenomenon Video that shows a variety of small objects scattered on a table. As students progress through the two experiences, they will use sense-making activities to help them answer the

Anchoring Phenomenon question, How can we organize these things?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Objects by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Special Needs For students who have language disorders such as cognitive-communication disorders, they may not know how to listen when someone is speaking to them. Model this process by having one student tell what they observed. Then you listen carefully and then repeat what the student said back to them. Throughout this activity, have students use this technique to ensure everyone knows when to listen and when to speak.

Original Text: Challenge For students that are ready for a challenge, give students photos of other daytime skies that look different from the one on the Hands-On Station Card. Challenge students draw labeled pictures of them.

Updated Text: Special Needs For students who need extra assistance organizing their thoughts, have students create a three-column graphic organizer. Instruct them to write one of the three questions in each column and then answer them as they complete the activity.

What can you see in the sky?

How will you use the picture on the card to answer the question?

What will you do in the Hands-On Activity to answer the question?

Challenge For students that are ready for a challenge, give students photos of other daytime skies that look different from the one on the Hands-On Station Card. Challenge students draw labeled pictures of them.

Original Text: (No bolding or punctuation in SEP section of Standards Coverage Chart)

Updated Text: (Added bolding and punctuation to SEP portion of Standards Coverage Chart. See below.)

K.1: Ask Questions and Define Problems

A: Ask questions and define problems based on observations or information from text, phenomena, models, or investigations. (Activities 1, 3)

K.1: Plan and Conduct Investigations and Design Solutions

B: Use scientific practices to plan and conduct simple descriptive investigations and use engineering practices to design solutions to problems. (Activities 6-9)

K.1: Collect Evidence

E: Collect observations and measurements **as evidence.** (Activities 2, 3, 4, 9)

K.1: Collect and Organize Data

F: Record and organize data using pictures, numbers, **words,** symbols, and simple graphs. (Activities 2, 4, and 9)

K.1: Develop and Use Models

G: Develop and use models to represent phenomena, objects, and processes **or design a prototype for a solution to a problem.** (Activity 8)

K.2: Analyze Data

B: Analyze data by identifying significant features and patterns. (Activities 2, 3, 4, 9)

K.2: Evaluate Engineering Designs

D: Evaluate a design or object using criteria to determine if it works as intended. (Activities 9 and 10)

K.3 Develop Explanations and Propose Solutions

A: Develop explanations and propose solutions supported by data and models. (Activities 7, 8, 10)

K.3: Listen Actively and Discuss

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 101 of 3538

C: Listen actively to others' explanations to identify important evidence **and engage respectfully in scientific discussion.**
(Activities 1, 3, 4, 5, 7)

K.4: Explore Scientists, Engineers, and Resources

B: Identify scientists and engineers such as Isaac Newton, Mae Jemison, and Ynes Mexia and explore what different scientists and engineers do. (Activity 6)

Original Text: In kindergarten, students will identify, describe, and predict the patterns of day and night and their observable characteristics. Day and night happen every day, and they follow a similar pattern. Patterns are things that repeat. The sun rises in one part of the sky, causing daytime. Throughout the day, the sun moves across the sky, then sets on the other side. When the sun sets, the moon rises in one part of the sky. Sometimes, the moon's size and shape are different. Even though the moon's appearance changes, it continues to move the same way throughout the sky. Eventually, the moon sets on the other side, and the sun rises again. This sun-and-moon pattern repeats daily, and it causes a pattern of day and night.

Updated Text: In kindergarten, students will identify, describe, and predict the patterns of day and night and their observable characteristics. Day and night happen every day, and they follow a similar pattern. Patterns are things that repeat. The sun rises in one part of the sky, causing daytime. Throughout the day, the sun moves across the sky, then sets on the other side. The moon rises in the same part of the sky where the sun rises. Sometimes, the moon looks different. Its size and shape seems to change. Even though the moon's appearance changes, it continues to move the same way throughout the sky. Eventually, the moon sets on the other side of the sky, and the sun rises again. This sun-and-moon pattern repeats daily, and it causes a pattern of day and night.

Updated Text: (updated descriptions/types on answer key)

Activity 1: Participation

Use the student responses to the engineering problem to check for proficiency of the success criteria. Use the "Define" section of the Engineering Design Rubric printable for guidance.

Activity 2: Participation

Activity 3: Student Edition Responses

Activity 4: Participation

Activity 7: Engineering Design Rubric

Check for proficiency of the success criteria using the 'Ideate' section of the Engineering Design Rubric.

Activity 8: Participation. Use student participation creating the plan, to check for proficiency of the success criteria.

Activity 9: Engineering Design Rubric.

Use the 'Test' section of the Engineering Design Rubric to check for proficiency of the success criteria.

Updated Text: Added: MISCONCEPTION BUTTON

True success comes from talent, not effort. Explain to students that scientists don't always find answers or solve problems the first time, and often times have to keep trying many times to succeed.

Added: MISCONCEPTION BUTTON

In science, you have to be accurate and precise at all times because there is no room for errors.

Original Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation on society.

Updated Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation on society.

Recurring themes and concepts. The student uses recurring themes and concepts to make connections across disciplines. Note: Content for TEKS 1 to 5 appears within all other Units. Examples are provided in the Texas Essential Knowledge and Skills section and detailed in correlations.

Original Text: 1 – Scientific and Engineering Practices

The student, for at least 40% of instructional time, asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or

correlations to develop evidence-based arguments or evaluate designs.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions. The student knows the contributions of scientists and recognizes the importance of scientific research and innovation on society.

The student understands that recurring themes and concepts provide a framework for making connections across disciplines.

Updated Text: 5 – Organisms and environments

The student knows that plants and animals depend on the environment to meet their basic needs for survival.

The student knows that organisms resemble their parents and have structures and undergo processes that help them interact and survive within their environments.

Updated Text: Discuss the results with the students. Ask students what they expected to happen with their experiment if their prediction was correct. For example the ice cubes melted in the glass in the Sun as it was all liquid, but not in the glass in the shade where there were solid ice cubes in the glass. What actually happened? Does this evidence support their prediction? They should summarize using quantitative and descriptive words.

Updated Text: Idea Boxes

Idea boxes placed throughout the chapter text function to provide opportunities for collaborative discussion of content, review of content introduced, and focus on certain content that is harder to grasp. Guidance on how to use the idea boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by:

- Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support).
- Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box.
- Planning to have at hand any materials needed to implement the Idea box.
- Reviewing the task information contained within the Idea boxes.

Original Text: Explain that the purpose of this interactive is to use a thermometer to identify materials that are hot and cold. Students will match a material with a given temperature, using a table to record their data. You may want to model how to use the table for data collection. Demonstrate the interactive by reading the introduction, and then click the continue button. Model how to drag the slider on the thermometer to see examples of things that are each temperature. Point out that the temperature is given in both degrees Celsius and degrees Fahrenheit. Point out to students that Fahrenheit is used most often in the United States but that Celsius is the scale scientists use so they will use the Celsius scale when they record their data. Explain that some thermometers show the temperature in both Celsius and Fahrenheit, while others show only one form. Students should continue dragging the bar up and down the thermometer to see various materials and temperatures. Check for understanding, and support students as needed.

Updated Text: Explain that the purpose of this interactive is to use a thermometer to identify changes to common objects when heat is added or removed. Students will first select water, butter, or ice cubes. Then, they will select "add heat" or

Location: Using the Interactive, first paragraph

Original Text: Explain that the purpose of this interactive is to use a thermometer to identify materials that are hot and cold. Students will match a material with a given temperature, using a table to record their data. You may want to model how to use the table for data collection. Demonstrate the interactive by reading the introduction, and then click the continue button. Model how to drag the slider on the thermometer to see examples of things that are each temperature. Point out that the temperature is given in both degrees Celsius and degrees Fahrenheit. Point out to students that Fahrenheit is used most often in the United States but that Celsius is the scale scientists use so they will use the Celsius scale when they record their data. Explain that some thermometers show the temperature in both Celsius and Fahrenheit, while others show only one form. Students should continue dragging the bar up and down the thermometer to see various materials and temperatures. Check for understanding, and support students as needed.

Updated Text: Explain that the purpose of this interactive is to use a thermometer to identify changes to common objects when heat is added or removed. Students will first select water, butter, or ice cubes. Then, they will select "add heat" or "remove heat." You may want to model how to read the thermometer. Point out that the temperature is given in both degrees Celsius and degrees Fahrenheit. Point out to students that Fahrenheit is used most often in the United States but that Celsius is the scale scientists use, so students will use the Celsius scale when they record their data. Explain that

some thermometers show the temperature in both Celsius and Fahrenheit, while others show only one form. As students explore, ask them to verbally explain how the materials change by heating and cooling. Check for understanding, and support students as needed.

Original Text: Have a whiteboard or poster ready to generate ideas with the class for students to implement in their gardens. Place sets of markers/crayons in the middle of each group’s work space.

Updated Text: This is a great opportunity for students to complete the lesson as a field investigation. Find an area on the school grounds where students would likely be able to build a garden to complete the activities. Have a whiteboard or poster ready to generate ideas with the class for students to implement in their gardens. Place sets of markers or crayons in the middle of each group’s workspace.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 214 of 3538

Original Text: We have explored how factors or conditions can cause objects, organisms, or systems to change or stay the same.

As you explored, how would you describe how different factors or conditions caused objects, organisms, or systems to change or stay the same.

Updated Text: We have explored how factors or conditions can cause objects, organisms, or systems to change or stay the same.

As you explored, think about the following questions:

- * What can cause an object to change or stay the same?
- * What can cause an organism to change or stay the same?
- * What can cause a system to change or stay the same?

Component: *Science Techbook for Texas by Discovery Education: Grade 1*

ISBN: 9781616291433

Current Page Number(s): <https://app.discoveryeducation.com/learn/player/d5c45fe2-ba11-40d2-89bf-b5ba3564ad86>

Location: Unit 4 > Concept 2 > Lesson 8 > Educator Notes > Supporting Science Themes (Slide 4)

Original Text: Next, invite students to share what they have explored about the Supporting Science Theme in the concept. Accept all ideas and help students to collaboratively connect their learning across all disciplines.

Updated Text: Next, invite students to share what they have explored about the Supporting Science Theme in the concept. Accept all ideas and help students to collaboratively connect their learning across all disciplines.

Say:

- An object is a nonliving thing. What can cause an object to change or stay the same?
- An organism is a living thing. What can cause an organism to change or stay the same?
- A system has different parts that work together. What can cause a system to change or stay the same?

Component: *Science Techbook for Texas by Discovery Education: Grade 1*

Original Text: Say: We have explored Scale, Proportion, and Quantity as we learned about Earth's Water.

Next, invite students to share what they have explored about the Supporting Science Theme in the concept. Accept all ideas and help students to collaboratively connect their learning across all disciplines.

Updated Text: Say: We have explored Scale and Quantity as we learned about Earth's Water. Scale is related to size, and quantity is related to numbers and measurements. Scientists use size and numbers to describe what they observe and make measurements.

Next, invite students to share what they have explored about the Supporting Science Theme in the concept. Accept all ideas and help students to collaboratively connect their learning across all disciplines.

Say:

- Size (scale) is how big or small something is. How did we use size (scale) to describe objects?
- Quantity is how much there is of something. How did we use quantity to describe objects?

Original Text: Matter is anything that has mass and takes up space.

Updated Text: Matter is anything that has mass and takes up space. Everything around us is matter that has physical properties that we can observe and identify with our senses, like shape, color, and texture, and attributes such as larger and smaller and heavier and lighter.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 225 of 3538

Students will first have to learn to successfully observe and identify properties before classifying. They will need to be able to communicate the properties they identify, using grade-appropriate language. When we classify objects based on these properties, we're grouping them based on similarities and differences. Examples of properties:

Shape refers to the form or outline of an object. Objects can have various shapes, such as round, square, rectangular, or triangular. The shape helps us recognize and differentiate different objects.

Color refers to the appearance of an object when light reflects off its surface. Objects can have different colors, such as red, blue, yellow, or green. We can identify and describe objects based on their color.

Texture refers to how an object feels when we touch it. Objects can feel smooth, rough, bumpy, soft, or hard. We can use our sense of touch to explore the texture of different objects.

Size refers to the physical dimensions of an object, such as how big or small it is. We can compare objects based on their size, such as something being taller or shorter, longer or shorter, or bigger or smaller.

Mass refers to how heavy or light an object is. We can compare the mass of different objects by lifting them or using a balance. Objects can be heavy, light, or somewhere in between.

Updated Text: Sometimes, when a change occurs, it can actually make an object more stable or secure. For example, if we reinforce a doghouse with stronger materials or add more support, it can become more stable and sturdier. These changes help the doghouse stay strong and protected, providing a safe place for a dog to rest.

On the other hand, some changes can lead to a need for more changes or modifications in an object like a doghouse. For instance, if we decide to add windows or a door to the doghouse, it may make it more comfortable and improve air circulation. However, these changes might also prompt additional adjustments, such as reinforcing the structure to accommodate the new openings.

Updated Text: Predicting changes caused by heating and cooling is important for understanding the behavior of matter. When a substance is heated or cooled, the increase or decrease in thermal energy can lead to various changes in its physical properties. One of the changes that can occur when heating or cooling a substance is a change of state. When solids are heated, they can melt into a liquid. When liquids are cooled, they can change into a solid.

Updated Text: Scientists use tools to measure and compare properties of matter. They will also record descriptive observations of matter that they identify. Recording observations allows them to document, describe, and identify findings, experiences, and ideas. By recording observations, they can refer to them later, compare different observations, and remember important details.

Current Page Number(s): 57D

Location: During Explain, EB/EL Leveled Support

Original Text: Beginning Make a knot. Say: Let's reverse my action. Undo the knot. Repeat the task, once reversing the action and once not. Ask: Did I reverse my action?

Intermediate Make a knot. Say: Let's reverse my action. Undo the knot. Repeat the task. Ask: What did I do?

Advanced/Advanced High Ask students to demonstrate reversing an action, explaining what they're doing to reverse it.

Updated Text: Beginning Make a knot. Say: Let's reverse my action. Undo the knot. Repeat the task, once reversing the action and once not. Ask: Did I reverse my action? Now have students write about it using the word reverse. Use the following sentence frame: I tied a knot. I can _____ the knot by untying it.

Intermediate Make a knot. Say: Let's reverse my action. Undo the knot. Repeat the task. Ask: What did I do? Now have students write about it using the word reserve. Sample answer: You tied a knot. You can reverse the knot by untying it.

Advanced/Advanced High Ask students to demonstrate reversing an action, explaining what they're doing to reverse it. Have students write about it using the word reverse. Sample answer: I took the cap off a marker. When I put it back on, I reverse the action.

Location: Topic 1 Overview, Preview the Topic

Original Text: Preview the Topic In this topic, students learn about matter and its properties. First, in Experience 1, they demonstrate and explain that a whole object is a system made of organized parts that can be taken apart and put back together again. Then, in Experience 2, students classify objects by observable physical properties such as shape, color, and texture, and by attributes such as size and weight. Finally, in Experience 3, students explain and predict changes in materials that are caused by heating and cooling. Preview the Phenomenon Students watch and respond to a short Anchoring Phenomenon Video that shows a section of a glacier breaking off and falling into the ocean. As students progress through the three Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, What is happening to the glacier?

SS 1.16.A Identify and state facts based on relevant evidence.

Component: *Grade 1 Teacher Guide*

ISBN: 9781323223321

Current Page Number(s): 7

Location: Home Connection Box

Original Text: Identify Parts of a Whole Object Have students use a wall clock or kitchen timer in their home to practice identifying whole objects and their parts. Have students create a 2-column chart in their Science Notebooks. The head for the first column should be labeled "Whole Object." Students should draw the entire clock or kitchen timer. The head for the other column should be labeled "Parts." Students should draw some of the parts of the clock or timer, such as the hands on a clock or the dial on a timer. Invite students to complete the same exercise with other commonly found objects in the home.

Component: *Grade 1 Teacher Guide*

ISBN: 9781323223321

Current Page Number(s): 16

Location: Differentiated Instruction Box

Original Text: Model Show students how to build a sturdy structure. Place big blocks as the base of the model. Add more blocks. Make sure the pieces are steady and supportive. Suggest to students that it would be better if the model were wider rather than taller. Caution students that the pieces can fall if they are not supported or if the structure becomes too tall.

Challenge Invite students to draw the structure they built on paper. They can then explain their design to other students.

Updated Text: Special Needs Students who need extra assistance organizing their thoughts may have difficulty explaining the structure they built. To help them organize their ideas, draw a horizontal line across the Hands-on Activity sheet to create a compare and contrast graphic organizer. Have students draw the blocks as separate items in the top half of the organizer and the structure they built in the bottom half of the organizer. Ask students to draw a line from the individual block to where they used it in the drawing of the completed structure.

Challenge Invite students to draw the structure they built on paper. They can then explain their design to other students.

Location: Topic 3, Force and Motion, Overview

Original Text: Preview the Topic In this topic, students learn that forces cause changes in motion and position in everyday life. In Experience 1 they will explain how pushes and pulls can start, stop, or change the speed or direction of an objects motion. Then, in Experience 2, students will plan and conduct a descriptive investigation that predicts how pushes and pulls can start, stop, or change the speed or direction of an object's motion. PREVIEW ANCHORING PHENOMENON Students watch a short Anchoring Phenomenon Video that shows a dog making its way through an obstacle course. The dog uses a variety of pushes and pulls to move itself around the weave poles and over the teeter totter. As students

progress through the Experiences, they will answer the Anchoring Phenomenon question, How can a dog complete an obstacle course

Updated Text: Preview the Topic In this topic, students learn that forces cause changes in motion and position in everyday life. In Experience 1 they will explain how pushes and pulls can start, stop, or change the speed or direction of an objects motion. Then, in Experience 2, students will plan and conduct a descriptive investigation that predicts how pushes and pulls can start, stop, or change the speed or direction of an object’s motion. As you progress through the topic, connect the activities back to Topic 1, Objects. Students can apply what they learned in Topic 1 about objects and the properties of matter (TEKS 1.6A) to what they are learning about pushes and pulls on objects in Topic 3. PREVIEW ANCHORING PHENOMENON Students watch a short Anchoring Phenomenon Video that shows a dog making its way through an obstacle course. The dog uses a variety of pushes and pulls to move itself around the weave poles and over the teeter totter. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, How can a dog complete an obstacle course Topic Readiness Test and Remediation Students answer questions to show what they already know about Force and Motion by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Location: Topic 4, Weather and Seasons, Overview

Original Text: Preview the Topic

In this topic, students learn the natural world has recognizable patterns of phenomena such as weather and seasons. First, in Experience 1, students will describe and record observable characteristics of weather and explain how weather affects their everyday lives. Then, in Experience 2, students will build on concepts from Experience 1 to describe and predict the patterns of the seasons.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of the weather on the same day in two different locations in the United States: Houston, Texas and Minneapolis, Minnesota. Although it is winter in both places, the weather is very different. In Houston, it is mild and rainy. In Minneapolis on the same day, it is very cold, and ice and snow cover the ground. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, Is Houston or Minneapolis a better place to build a snowman?

Updated Text: Preview the Topic

Location: Topic 5, Earth Materials, Overview

Original Text: Preview the Topic

In this topic, students learn about natural materials found on Earth, specifically rocks, soil, and water. First, in Experience 1, they investigate, describe, and record the different properties and components of topsoil, clay, and sand. Then, in Experience 2, students study water and compare the properties, such as salinity, color, clarity, size, and shape, of puddles, ponds, streams, rivers, lakes, and oceans. Next, in Experience 3, students investigate and describe how water can move rock and soil particles from one place to another. They also identify and describe how plants, animals, and humans use rocks, soil, and water. Finally, in Experience 4, students explain why conservation is important and describe ways to conserve water and ways to protect natural sources of water.

PREVIEW ANCHORING PHENOMENON Students watch and respond to a short Anchoring Phenomenon Video that is about beavers and how the dams they build change and help environments. As students progress through the Experiences, they will answer the Anchoring Phenomenon question Why would beavers need to collect rocks, soil, and parts of trees?

Original Text: Preview the Topic

In this Topic, students learn about animals, specifically about the external structures of birds, mammals, and fish; how animals grow and change; and how animals go through a life cycle. First, in Experience 1, students compare how the external structures of different animals help them live, interact, and survive in their environment. Then, in Experience 2, they identify and compare ways young animals resemble their parents. Finally, in Experience 3, students record observations and describe the basic life cycles of a bird, mammal, and fish.

Preview the Anchoring Phenomenon

Students watch and respond to a short Anchoring Phenomenon Video about armadillos and how their body parts help them move, find food, and survive in their environments. As students progress through the Experiences, they will answer the Anchoring Phenomenon question What can an armadillo do with its body?

Updated Text: Preview the Topic

In this Topic, students learn about animals, specifically about the external structures of birds, mammals, and fish; how animals grow and change; and how animals go through a life cycle. First, in Experience 1, students compare how the external structures of different animals help them live, interact, and survive in their environment. Then, in Experience 2, they identify and compare ways young animals resemble their parents. Finally, in Experience 3, students record observations and describe the basic life cycles of a bird, mammal, and fish.

As you progress through the topic, connect the activities back to Topic 6, Living Things and Environments. Students can apply what they learned in Topic 6 about how living things have basic needs (TEKS 1.12A) to how the structures of animals help them survive in an environment. They can also apply what they learned about living things producing young to parents and young animals (TEKS 1.12B) and life cycles they learn about in Topic 7.

Preview the Anchoring Phenomenon

Students watch and respond to a short Anchoring Phenomenon Video about armadillos and how their body parts help them move, find food, and survive in their environments. As students progress through the Experiences, they will answer the Anchoring Phenomenon question What can an armadillo do with its body?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Animals by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Lead a class discussion about what students think is happening in the video. Accept all ideas at this time. As students complete the sense-making activities in this topic, they will return to the Anchoring Phenomenon with greater clarity. Remind students that learning, like science, is an iterative process. It's okay to start with one idea and revise your idea as you get more information.

Texas Connection The Nine-Banded Armadillo is the state mammal of Texas. Armadillos are found throughout the State of Texas with the exception of the Trans-Pecos region. The hard shell of the armadillo can protect it from predators such as coyotes, bobcats, and alligators. Armadillos use their strong claws to dig up insects to eat.

Location: Experience 1, Animal Structures, Explore

Original Text: GUIDE STUDENT PLANNING Inform students that cats have body parts called whiskers. Cats carefully use their whiskers to judge whether or not their heads and bodies can fit through an opening.

Explain that in the Station, students will make a model of a cat head and then use it to investigate how a cat uses its whiskers. Suggest that students make a drawing of a cat head first. Encourage students to use the drawing to plan how they will make the model cat head.

DIFFERENTIATED INSTRUCTION

Identifying Features on a Model To help students identify parts of the model cat head, suggest that they use markers or crayons to add features, such as eyes, a nose, and a mouth, to create a cat's face.

Updated Text: GUIDE STUDENT PLANNING Explain that in the Station, students will make a model of a cat head and then use it to investigate how a cat uses its whiskers. Suggest that students make a drawing of a cat head first. Encourage students to use the drawing to plan how they will make the model cat head.

DIFFERENTIATED INSTRUCTION

Striving To help students identify parts of the model cat head, suggest that they use markers or crayons to add features, such as eyes, a nose, and a mouth, to create a cat's face.

Challenge Have students who need an extra challenge investigate how the length of a cat's whiskers affects how accurately the cat can detect the size of holes.

Current Page Number(s): 3.14

Location: Teacher Edition, Unit 3, Activity 1, "Wellness: Coping Strategies for Change" (PDF pg. 14)

Original Text: Whole Group

1. Guide children through a short breathing exercise. Discuss how they feel after the breathing exercise.
2. Show students the Change Affects Everyone video.
 - a. Ask: What kinds of changes did the video talk about? (family, world, weather, technology)
 - b. Ask: what was the big adaptation that the video explained? (communication)
3. Read the articles together as a class and discuss the following:
 - a. What does it mean to adapt? (learning to live with change)
 - b. Is adapting always easy? Why or why not?
 - c. Do we always like change?
 - d. How does change make us feel sometimes?
 - e. What can you do to help your well-being when it comes to change?
4. Show students the Change Controller image.
 - a. Discuss with the class that we are the ones in control of our responses. We get to choose how we respond to what is happening.
 - b. Consider hanging the Change Controller image in your classroom to support students in making choices.
5. Reread the article "Coping Strategies for Change."
6. Write the examples listed in the article on the board.
7. Ask the students to think of other ideas of what they can do when they have to deal with change (e.g., go outside and enjoy the sunshine, write in a journal, talk with someone you trust, do something that you really enjoy).

Independent Work

1. Give students the Change Controller printable.
2. Using the Adapt Controller Example printable, have the students add the labels and definitions to the printable.

Updated Text: This is an opportunity for students to learn about how to cope with change through an activity.

Current Page Number(s): 5.29-5.30

Location: Teacher Edition, Unit 5, Activity 7, "Wellness: Build Each Other Up" (PDF pg. 29-30)

Original Text: Whole Group:

1. Discuss: Was it hard to come up with one idea together? What was hard about it? (Answers may vary. Example: It was hard because I wanted to just do my idea, but we had to take a part of everyone's idea so that it was fair.)
Say: Something that makes working in a group easier is being kind to one another. We can do this by building each other up. What do you think that means? (Answers may vary but could include being kind, being respectful, etc.)
3. Read the Build Each Other Up printable together.
4. After you have reviewed and identified strengths, help the students understand it may be hard to remember their own strengths. That is when a team comes together to build each other up.
5. Set up four stations in the room, and divide the class into four groups. Each group will rotate through each station. In each station, students will practice building one another up, using the strategy at the station and the sentence stems provided.
 - a. Station 1: Speak encouraging words to each other.
I like how you _____.
You are good at _____.
 - b. Station 2: Celebrate the success of others.
I saw you _____.
You can _____.
_____ might have been hard for you, but you did it!
 - Station 3: Show gratitude.
We are lucky to have you on our team because _____.
 - d. Station 4: Always say kind things about your teammates to others.
I love working with _____.
_____ really knows how to work hard.
6. Help the students remember that sometimes, working in a team can be frustrating.
 - a. Say: If we focus on the frustrating things, the work will be frustrating. Communication is important in making sure everyone wants to reach the final goal. If a team member is frustrated, there may be a reason for it. Work together to try to fix the problem.

Updated Text: In this lesson, students learn how to speak kindly to each other and build each other up.

Original Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

Updated Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

The student uses recurring themes and concepts to make connections across disciplines. Note: Content for TEKS 1 to 5 appears within all other Units. Examples are provided in the Texas Essential Knowledge and Skills section and detailed in correlations.

Original Text: Explain that the purpose of this interactive is to figure out the difference between natural and manmade resources, then to determine which resources humans can get more of and which we cannot, and finally to understand how to conserve resources. In the first part of the interactive, students will sort resources by dragging them into Natural Resources or Manmade Resources categories, using a graphic organizer to record their data. (You may want to review how to use the graphic organizer for data collection.) In the second part of the interactive, students will sort resources by dragging them into Renewable or Nonrenewable categories, then explore how to conserve both a renewable and nonrenewable resource.

Updated Text: Explain that the purpose of this interactive is to explore the difference between natural and manmade resources, then to determine resources that humans use and how we can conserve resources. In the first part of the interactive, students will sort items by dragging them into Natural Resources or Made from Natural Resources categories, using a graphic organizer to record their data. (You may want to review how to use the graphic organizer for data

Original Text: Students should begin by clicking on the trees so that they only work with the Gifts from Nature portion of the interactive. For the first few screens, read aloud the text at the bottom of the screen, or invite student volunteers to read aloud. Click Next to advance through the screens.

On the sorting screen, demonstrate the interactive by reading aloud the text at the bottom of the screen and dragging the fossil fuel to the Natural Resources category. Explain that fossil fuels are resources such as oil and gas that are taken out of the earth. Students should click and drag each object to the correct category. Students should read the text at the bottom of the screen each time an object is dragged to a category correctly. When they finish the first set of resources, instruct them to click. Next to move to a new set of resources that they should sort in the same manner.

Updated Text: Students should begin by clicking Activity 1. For the first two screens, students should drag the items into the correct category and read or listen to the information to learn about each resource. You may want to explain that fossil fuels are resources such as oil and gas that are taken out of Earth. Students should click and drag each object to the correct category. Next, have students click the arrow to learn about other natural and manmade resources such as food. Students should watch and listen to or read the information about the hamburger and music player to learn more about resources. Instruct students to finish Part 1 of the interactive by clicking Next or the Home button at the top of the screen.

(You may want to review how to use the graphic organizer for data collection.) In the second part of the interactive, students will sort resources by dragging them into Renewable or Nonrenewable categories, then explore how to conserve both a renewable and nonrenewable resource.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 389 of 3538

Original Text: Students should begin by clicking on the trees so that they only work with the Gifts from Nature portion of the interactive. For the first few screens, read aloud the text at the bottom of the screen, or invite student volunteers to read aloud. Click Next to advance through the screens.

On the sorting screen, demonstrate the interactive by reading aloud the text at the bottom of the screen and dragging the fossil fuel to the Natural Resources category. Explain that fossil fuels are resources such as oil and gas that are taken out of the earth. Students should click and drag each object to the correct category. Students should read the text at the bottom of the screen each time an object is dragged to a category correctly. When they finish the first set of resources, instruct them to click. Next to move to a new set of resources that they should sort in the same manner.

Updated Text: Students should begin by clicking Activity 1. For the first two screens, students should drag the items into the correct category and read or listen to the information to learn about each resource. You may want to explain that fossil fuels are resources such as oil and gas that are taken out of Earth. Students should click and drag each object to the correct category. Next, have students click the arrow to learn about other natural and manmade resources such as food. Students should watch and listen to or read the information about the hamburger and music player to learn more about resources. Instruct students to finish Part 1 of the interactive by clicking Next or the Home button at the top of the screen.

Component: *Science Techbook for Texas by Discovery Education: Grade 2 Unit 2 Teacher Edition*

ISBN: 9781616291846

Current Page Number(s): 15

Location: Last paragraph

Original Text: Circle the natural resources. Students should circle the cow, air, mineral, and water drop.

When students have finished sorting, instruct them to click Next to advance to the next screen. They should follow the instructions in the text at the bottom of the screen to explore the resources that go into a hamburger and a music player. Students should then read the final text that explains how we use resources in our lives. Instruct students to finish Part 1 of the interactive by clicking Next or the Home button at the top of the screen.

Updated Text: Circle the natural resources. Students should circle the cow, air, mineral, and water drop.

Component: *Science Techbook for Texas by Discovery Education: Grade 2 Unit 2 Teacher Edition*

ISBN: 9781616291846

Current Page Number(s): 16

Location: Part 2

Original Text: Once students have completed the first part and returned to the main screen, instruct them to click the recycling bin to begin the second part. For the first few screens, read aloud the text at the bottom of the screen, or invite student volunteers to read aloud. Click Next to advance through the screens.

Guide students through the sorting screen. Instruct them to drag the tree, water, soil, and air to the category Renewable Resources. Instruct them to drag the iron, copper, oil, and coal to the category Nonrenewable Resources. Read aloud the text that appears at the bottom of the screen each time a resource is placed in a category, or invite student volunteers to read it aloud. Then, instruct students to click Next to advance.

Have students watch the animation on the next screen and read the text at the bottom of the screen. Students should then click Next. On the screen with paper, read aloud the text at the bottom of the screen. Students should click Next to begin. They should click the buttons to the left one at a time, then watch the animation and read the text at the bottom of the screen. When they have clicked all three buttons, they should click Next. Again, students should click the buttons to the left of the bottles one at a time, watching the animation and reading the text at the bottom of the screen each

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 390 of 3538

time. Then, they should click Next to reach the last screen. Students should read the text at the bottom of the screen, then click Next to finish the interactive.

Updated Text: Once students have completed the first activity and returned to the main screen, instruct them to click on Activity 2. For the first two screens, have students observe the images and read or listen to the text at the bottom of the screen. They should click the arrow button to advance through the screens. Instruct them to sort the resources by dragging them to the correct category while listening to or reading the information about each resource. Then, instruct students to click the arrow to advance.

Next, have students watch the animation on the next screen and read or listen to the text at the bottom of the screen to learn how to conserve our resources. On the next couple of screens, they will discover how to conserve trees by changing the way paper is used and conserve oil by changing how plastic bottles are used by clicking on the reduce, reuse, and recycle buttons to watch the animations and read or listen to the information. Lastly, they will think again about the resources they use and throw away each day to consider how to limit human impact by making choices to conserve and properly dispose of resources.

Original Text: Explain that the purpose of this interactive is to learn about the different parts of a plant and how the plants use these parts to grow. Students will use the interactive to demonstrate their understanding of these parts. Students will use a chart to record their data. (You may want to review how to use the chart for data collection.)

Demonstrate the interactive by first telling students that they will complete the interactive by choosing either the seed or plant to learn more about. In either choice, students will follow the directions to identify what seeds and plants need to grow. They will then record the information in the graphic organizer.

Updated Text: Demonstrate the interactive by first telling students that they will complete the interactive by exploring both the seed and plant part activities. In either choice, students will follow the directions to identify what seeds and plant parts use for growth. They will then record the information in the graphic organizer.

Original Text: We use different forms of energy and different properties every day. We change properties of materials to suit our everyday needs such as freezing or thawing food. This is an excellent opportunity to help students think about identifying forms of energy and properties of matter. As students work through the unit, encourage them to notice the following:

- when they use different forms of energy, such as heat, in their daily lives
- when and how they change the properties of materials in the classroom, such as cutting paper, sharpening a pencil, or breaking a crayon

Updated Text: Matter is all around and has different properties. The properties of materials can change through processes such as freezing, cutting, folding, and melting. This is an excellent opportunity to help students think about energy and matter. As students work through the concept, encourage them to notice the following:

- We can identify materials based on their properties.
- Sometimes the properties of materials (matter) can change through processes such as heating or cooling.
- Matter can also be combined to form new objects for different purposes.

After students learn more about changing materials, they can engage in a similar process to identify forms of energy and properties of matter.

Original Text: • What happens in tug-of-war if both teams pull equally hard on the rope? Sample response: Neither team wins because neither team can pull the rope to their side.

Updated Text: • What happens in tug-of-war if both teams pull equally hard on the rope? Sample response: Neither team wins because neither team can pull the rope to their side.

• How could you draw each scenario using arrows to show what might happen on each side of the rope? Sample response: I would draw a vertical line and then a horizontal line intersecting the vertical line to represent the rope. I would draw arrows in the direction the rope is moving. I would show more rope on the side that is receiving more force. If both sides have equal force, the vertical line would intersect the middle of the rope and the arrows would be pointing in opposite directions.

Original Text: Intermediate

Verbally provide sentence frames and ask students to say the words to complete the sentences. The sentence frames can include: A push or pull is a _____. A force changes the _____ of an object. The greater the force on an object, the _____ the change in its motion. Replay the video as needed.

Advanced

Replay the video, and pause at different examples of force. Have students identify if the force is a push or pull and the motion that was caused by the force.

Advanced High

Have students work in small groups and share something new they learned about force, using the words used in the video.

Updated Text: Intermediate

Verbally provide sentence frames and ask students to say the words to complete the sentences. The sentence frames can include: A push or pull is a _____. A force changes the _____ of an object. The greater the force on an object, the _____ the change in its motion. Replay the video as needed. Next, have students write the sentences.

Advanced

Replay the video, and pause at different examples of force. Have students identify if the force is a push or pull and the motion that was caused by the force.

Advanced High

Have students work in small groups and share something new they learned about force, using the words used in the video. Then, have them individually write down what they learned about force to reflect.

Original Text: Preparation

Gather materials in advance. Consider using Discovery Education Experience to access images to laminate for students to use in the activity. If you are unable to laminate the images, you may want to print extra copies in case they become unusable. This lesson utilizes stations. Each part below should be set up as a separate station for students to rotate through. Part 1: Pictures of heavy and light things found on a playground (such as slide, playscape, large rock) Part 2: Pictures of hot and cold things found on a playground (such as hot metal slide, juice box) Part 3: Box or bin filled with objects that have different textures and are found on a playground (such as rope, tree bark, plastic ball, seat of swing) Part 4: Pictures of big and little things found on a playground (such as slide, playscape, small rock)

Original Text: Discuss with the students the difference between the trash that goes to the landfill and the trash that goes to the recycling center. Explain that the trash that goes to the landfill will decompose (rot) over time.

Updated Text: Discuss with students some different items that can be found in a landfill. Explain that the trash that goes to the landfill will decompose (rot) over time and can get into our natural environment. Have students look at the picture of the landfill and share if they think the items in landfills are natural or manmade resources. Then tell them that they will read about about how environmental engineers protect natural resources.

Original Text: Guided and Open Options

For guided and open inquiry, students are expected to develop materials lists, write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Updated Text: Structured and Open Options

For structured inquiry, students are given a procedure. For open inquiry, students are expected to develop materials lists, write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Component: McGraw Hill Texas Science, Grade 2, Teacher Edition

ISBN: 9781265515850

Current Page Number(s): 14B

Location: Guided Inquiry

Original Text: Guided Inquiry

Provide the explorable question. Ask: How can a pantry be organized to help make it easy to find ingredients? Example Students might choose to incorporate organization tools such as organizer bins or can rack organizers into their designs. Investigations must answer the explorable question.

Updated Text: Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question. Ask: How can a pantry be

organized to help make it easy to find ingredients?

Example Option 1: Students can sort the food by sizes of the containers they are in. They could put all of the larger containers together and all of the smaller containers together. Option 2: Students can sort the food by the type of food it is. They could put all of the spices together in a group. All of the pasta could go together in another group. The cereal could make another group. Then consolidate the others into another group. Option 3: The students could sort the food by wet and dry food. Option 4: The students could introduce food storage solutions and sort the food using food containers.

Component: McGraw Hill Texas Science, Grade 2, Teacher Edition

Original Text: Download the student page for structured inquiry.

Updated Text: Download the student page for guided inquiry.

Component: McGraw Hill Texas Science, Grade 2, Teacher Edition

ISBN: 9781265515850

Current Page Number(s): 58A

Location: Right column, Identify a Problem/Brainstorm a Solution

Original Text: Students should discuss and record potential solutions to the problem. They will choose one solution to develop in the following steps. Say: Think back to the photo of the brick building and how bricks are put together. Demonstrate how you can combine the materials in different ways to make the tallest tower.

Updated Text: Demonstrate how you can combine the materials in different ways to make the tallest tower. Students should discuss and record potential solutions to the problem. They will choose one solution to develop in the following steps.

Component: McGraw Hill Texas Science, Grade 2, Teacher Edition

ISBN: 9781265515850

Current Page Number(s): 58B

Location: Guided and Open Options

Original Text: Guided and Open Options
For guided and open inquiry, students are expected to develop materials lists, write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Updated Text: Structured and Open Options
For structured inquiry, students are given a procedure. For open inquiry, students are expected to develop materials lists, write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Component: McGraw Hill Texas Science, Grade 2, Teacher Edition

ISBN: 9781265515850

Current Page Number(s): 58B

Location: Guided Inquiry

Original Text: Guided Inquiry
Provide the explorable question.
Say: Think back to the photo of the brick building and how bricks are put together. Demonstrate how you can combine the materials in different ways to make the tallest tower. Example Students may think back to what they have learned about the properties of materials to help them determine which materials would help them construct the tallest tower. Investigations must answer the explorable question.

Updated Text: Structured Inquiry
Provide step-by-step instructions to help students investigate the explorable question.
Say: Think back to the photo of the brick building and how bricks are put together. Demonstrate how you can combine the materials in different ways to make the tallest tower.
Example Step 1. Use uncooked spaghetti noodles, toothpicks, and chenille stems to build a structure. Step 2. Use tape and modeling clay to hold the materials together. Step 3. Measure your structure and compare with your classmates. Step 4: Brainstorm ways to make your structure taller and more stable.

Component: McGraw Hill Texas Science, Grade 2, Teacher Edition

ISBN: 9781265515850

Current Page Number(s): 58B

Location: Open Inquiry box

Original Text: Students write their own explorable question.

Ask: What questions did you have when you observed the photo of the building?

Plan the Investigation Make sure students choose a testable question. Ask: Can your question be investigated through research, observation, modeling, and/or experimentation?

Updated Text: Students identify their own problem. Ask: What problem could you solve using the Engineering Design Process? Plan the Investigation Make sure students choose an engineering design problem they can solve using the resources available.

Location: Topic Overview, Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about matter. First, in Experience 1, they investigate the properties of matter, including texture, flexibility, and temperature. Then, in Experience 2, they investigate changes in matter through processes such as cutting, folding, sanding, melting and freezing. In Experience 3, students demonstrate that matter can be made up of objects that are made up of smaller units and that those units can be combined or reassembled to form new objects for different purposes. They also explain why materials are chosen based on their physical properties.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video about making chocolate candy at home. As students progress through the experiences, they will answer the Anchoring Phenomenon question, How do the properties of this chocolate change?

Texas Connection Texas is the fourth largest producer of peanuts in the United States. Have students think of something made of peanuts, such as Texas peanut brittle. Ask Why do people use peanuts for peanut brittle? When peanut brittle is made, do the properties of the peanuts change?

Teacher Background

Watch the Teacher Background Video Matter to refresh your knowledge of topic content. Key concepts to support instruction of this topic include:

- Matter has physical properties, such as shape and flexibility, and it can be classified by its physical properties.
- States of matter, such as solid and liquid, are physical properties, and they can be changed by melting or freezing.
- Physical changes are changes to a material, such as folding, sanding, or cutting, that do not make a new kind of matter. Changes to state of matter are physical changes.
- Small units of matter can be combined to make new objects with different purposes.
- Engineers choose materials to build their designs based on the materials' physical properties.
- Tempering chocolate is a physical change like melting ice and refreezing it at different temperatures. It controls how the crystals reform.

Common Misconceptions

Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Air is not matter because it cannot be seen.** Blow air into a balloon to demonstrate that air has mass and takes up space.

- Making physical changes to the physical properties of a material changes it into a different kind of material. The Hands-On Station Activity in Experience 2 will help students see that a new kind of matter is not made when changes are made to its physical properties.
- Changing the state of matter of a material changes it into a different kind of material. The Literacy Station Activity in Experience 2 will help students see that freezing or melting a material does not change it into a different kind of matter.

Updated Text: Preview the Topic

In this topic, students learn about matter. First, in Experience 1, they investigate the properties of matter, including texture, flexibility, and temperature. Then, in Experience 2, they investigate changes in matter through processes such as cutting, folding, sanding, melting and freezing. In Experience 3, students demonstrate that matter can be made up of objects that are made up of smaller units and that those units can be combined or reassembled to form new objects for different purposes. They also explain why materials are chosen based on their physical properties.

As you progress through the topic, connect the activities back to what students learned in Grade 1. Students can apply what they learned about classifying objects by observable properties (TEKS 1.6A) and the properties of particles in different soil types (TEKS 1.10A) to what they are learning in about properties such as texture (TEKS 2.6A). They can build off what they learned about changes to materials through heating (TEKS 1.6B, 1.8B) to what they are learning about processes that change matter (TEKS 2.6B).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video about making chocolate candy at home. As students progress through the experiences, they will answer the Anchoring Phenomenon question, How do the properties of this chocolate change? Texas Connection Texas is the fourth largest producer of peanuts in the United States. Have students think of something made of peanuts, such as Texas peanut brittle. Ask Why do people use peanuts for peanut brittle? When peanut brittle is made, do the properties of the peanuts change?

TOPIC READINESS TEST AND REMEDIATION

Students answer questions to show what they already know about Matter by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Teacher Background

In this topic, students learn about force and motion. First, in Experience 1, they

investigate how objects push on each other and how they may change shape when they touch or collide. Then, in Experience 2, students investigate how the strength of a push or pull can change an object's motion.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon video that shows how construction machinery uses pushes to change the shape and features of land. As students progress through the experiences, they will answer the Anchoring Phenomenon question, How does construction change the land?

Updated Text: Preview the Topic

In this topic, students learn about force and motion. First, in Experience 1, they investigate how objects push on each other and how they may change shape when they touch or collide. Then, in Experience 2, students investigate how the strength of a push or pull can change an object's motion.

As you progress through the topic, connect the activities back Topic 1, Matter. Students can apply what they learned in about the observable physical properties of material (TEKS 2.6A) and how properties can be changed through processes such as folding (TEKS 2.6B) to explain how objects push on each other and may change shape when touch or collide (TEKS 2.7A).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon video that shows how construction machinery uses pushes to change the shape and features of land. As students progress through the experiences, they will answer the Anchoring Phenomenon question, How does construction change the land?

TOPIC READINESS TEST AND REMEDIATION

Students answer questions to show what they already know about Force and Motion by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Location: At-A-Glance; Objective

Original Text: Objective
Students will explain
how objects push on
each other and how
some objects change
shape when they touch
or collide.

Updated Text: Objective

Students will investigate and explain how objects push on each other and predict how some objects change shape when they touch or collide.

Component: *Grade 2 Teacher Guide*

ISBN: 9781323223338

Current Page Number(s): 52

Location: At-A-Glance; Objective

Original Text: Objective

Students will plan and investigate how the strength of a push or pull affects an object's motion.

Updated Text: Objective

Students will plan and conduct a descriptive investigate to predict the cause and effect relationship about how the strength of a push or pull can change an object's motion.

Component: *Grade 2 Teacher Guide*

ISBN: 9781323223338

Current Page Number(s): 56

Location: Explore; During the Stations

Original Text: During the Station

Students will explore and build understanding toward TEKS 2.7B with the following stations.

Hands-On Station How can you move the ball?

STATION SETUP Hands-On Station Card, Hands-On Station Activity, ball, straw, tape, ruler or tape measure, safety goggles
SAFETY Wear safety goggles and do not share straws to demonstrate safe practices during investigations as outlined in Texas Education Agency-approved safety standards.

WHAT TO EXPECT Students conduct an investigation to see how they can move a ball while blowing through a straw.

They will observe how the strength of a blow (the push) affects how far the ball moves. They will record and explain their observations on their Hands-On Activity.

GUIDE STUDENT PLANNING Explain that investigations can be used to ask or answer a question. In this investigation, students will be answering a question. Encourage students to use the words push and strength as they plan and conduct their investigation.

Ask:

- What question are you trying to answer?
- What will you change in the investigation?
- How can you make sure that you and your partner are investigating in a safe way?

GUIDED INQUIRY PROCEDURE If students need help designing their investigation, suggest these guided inquiry steps to model and support the inquiry process.

1. Put the ball on a flat surface. Place a piece of tape at this point.

2. Point the straw at the ball. Gently blow through the straw.

3. Place a piece of tape where the ball stops moving. Measure the distance from where the ball started to where it stopped moving. Record the distance.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 501 of 3538

4. Put the ball back at the starting point.
5. Point the straw at the ball. Blow harder through the straw.
6. Place a piece of tape where the ball stops moving. Measure the distance from where the ball started out to where it stopped moving.
7. Record the distance. Compare the distances.

DIFFERENTIATED INSTRUCTION

Plan and Conduct an Investigation Model how to plan an investigation. Then show students how to follow the plan and conduct the investigation. Be sure to put on safety goggles. Show how to blow through the straw. Tell students not to blow too hard or the ball will move too far. Demonstrate how to place tape at the point where the ball starts and where it stops moving. Model how to measure the distances between the start and end points.

Updated Text: During the Station

Students will explore and build understanding of TEKS 2.7B in the following stations.

Hands-On Station How can you move the ball?

STATION SETUP Hands-On Station Card, Hands-On Station Activity, ball, straw, tape, ruler or tape measure, safety goggles

SAFETY Wear safety goggles and do not share straws to demonstrate safe practices during investigations as outlined in Texas Education Agency-approved safety standards.

(Slide)

Exit Ticket

Compare Tell how the structures or behaviors of each animal help it find or take in food.

(Photo of anteater)(Photo of honey bees in a honey comb)(photo of a spider in a web)

(slide notes)

Exit Ticket

Teacher Support

Complete this activity as a class or print the slide for use by individual students or student pairs.

Read aloud the directions.

If necessary, review the meanings of structure and behavior.

Call on students to name the animal in each picture.

Have student partners discuss the answer for each picture.

Move around the classroom and listen to assess student ideas.

Then ask volunteers to share their answer.

Ask the group whether they want to change or add anything in the answer.

Record a final answer.

Display the next slide to show students the correct answers.

Original Text: (Update Teacher Support)

How does the strength of a push change an object's motion?

Teacher Support

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 504 of 3538

Have students repeat the key term word. If students need vocabulary support, review the vocabulary card or slide 1 as a class.

Vocabulary Support

Make sure students correctly pronounce the vocabulary word strength.

If students have trouble pronouncing it, have them say the word length.

The rhyming sound might help students correctly pronounce the vocabulary word.

Discussion

Look at the pictures with students. Point out that the red arrow stands for the strength of a push that was used to make the swing move. A longer arrow stands for a push with a greater force.

Ask In which picture was a stronger push used? (the picture on the right)

Ask Describe the motion of the swing in each picture. (The swing on the right moved a greater distance and went higher than the swing on the left.)

Ask Why did the motion of the swing changes from the first picture to the second picture? (A stronger push was used on the right.)

Try it Out!

Have students think of an object that moves, such as a door, a grocery cart, or a shovel. Then have students draw two pictures, one that shows how the object will move when a small push is used and one that shows how the object will move when a large push is used. Allow students to show their drawings to the class and to describe the cause-and-effect of the pushes in their drawings.

Updated Text: (Update Teacher Support)

How does the strength of a force change an object's motion?

Teacher Support

Have students repeat the key term word. If students need vocabulary support, review the vocabulary card or slide 1 as a class.

Vocabulary Support

Make sure students correctly pronounce the vocabulary word strength.

If students have trouble pronouncing it, have them say the word length.

The rhyming sound might help students correctly pronounce the vocabulary word.

Discussion

Look at the pictures with students. Point out that the red arrow stands for the strength of a push that was used to make the swing move. A longer arrow stands for a push with a greater force. These arrows model forces. They can be used to model the strength of a pull too.

Ask In which picture was a stronger push used? (the picture on the right)

Ask Describe the motion of the swing in each picture. (The swing on the right moved a greater distance and went higher than the swing on the left.)

Ask Why did the motion of the swing changes from the first picture to the second picture? (A stronger push was used on the right.)

Try it Out!

Have students think of an object that moves, such as a door, a grocery cart, a wagon or a shovel. Then have students draw two pictures, one that shows how the object will move when a small push is used and one that shows how the object will move when a large push is used. Repeat this activity to show how the object will move when a small pull is

used and then when a large pull is used. Allow students to show their drawings to the class and to describe the cause-and-effect of the pushes in their drawings.

Location: Topic 4 Overview, Preview the Topic

Original Text: Preview the Topic

In this topic, students learn that the natural world has recognizable patterns that can be observed in systems and processes. First, in Experience 1, they describe the sun as a star and recognize that the moon reflects the sun's light. Then, in Experience 2, they measure, record, and graph weather information. Finally, in Experience 3, they investigate different types of severe weather events and explain that each one is most common in a given region of the United States.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video that shows how weather is changing along a stretch of highway. As students progress through the experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How is the weather changing?

Teacher Background

Watch the Teacher Background Video, Patterns in the Sky, to refresh your knowledge of topic content. Key concepts to support instruction of this topic include:

- The natural world has recognizable patterns that can be predicted.
- The sun is a star that provides light and heat, and the moon reflects the

sun's light.

- Objects in the sky are more visible and can appear different with a telescope than with an unaided eye.
- Weather information, such as temperature and precipitation, can be observed, measured, recorded, and graphed.
- Some types of severe weather events are hurricanes, tornadoes, and floods.
- Some types of severe weather events are more likely to occur in some regions than in others.

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- The stars in the night sky are much smaller than our sun. In Experience 1, reinforce that distance is a factor when comparing the way objects in space appear to us on Earth. For example, the sun is a medium-sized star that looks enormous from our vantage point on Earth. Yet the sun is smaller than many of the stars in our galaxy, which appear to us as tiny points of light in the night sky.
- Severe weather events occur randomly. Students learn in Experience 3 that each type of severe weather requires specific conditions that occur only in certain places. For example, hurricanes are fueled by warm ocean water. As a result, they form over warm oceans. Note that this is why coastal cities of eastern Texas, such as Galveston and Corpus Christi, have long histories of hurricane damage, whereas inland cities of western Texas, such as El Paso and Amarillo, do not

Updated Text: Preview the Topic

In this topic, students learn that the natural world has recognizable patterns that can be observed in systems and processes. In Experience 1, they describe the sun as a star and recognize that the moon reflects the sun's light. In Experience 2, they measure, record, and graph weather information. In Experience 3, they investigate types of severe weather events and

explain that each one is most common in a given region of the United States.

As you progress through the topic, connect the activities back to Topic 3, Sound and Volume. Students can use what they learned about sound and vibrations (TEKS 2.8A) and apply it to what they learn in Topic 4 about severe weather events such as tornadoes (TEKS 2.10C). They can also apply what they learned about how people use levels of sound (TEKS 2.8B) to how devices that use sound could be used to warn people about severe weather events (TEKS 2.8C).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video that shows how weather is changing along a stretch of highway. As students progress through the experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How is the weather changing?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Patterns in the Sky by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Watch the Teacher Background Video, Patterns in the Sky, to refresh your knowledge of topic content. Key concepts to support instruction of this topic include:

- The sun is a star that provides light and heat. The moon reflects the sun's light.
- Objects in the sky are more visible and can appear different with a telescope than with an unaided eye.
- Weather information, such as temperature and precipitation, can be observed, measured, recorded, and graphed.
- Some types of severe weather events are hurricanes, tornadoes, and floods. These events are more likely to occur in some regions than in others.

Common Misconceptions

Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- The stars in the night sky are much smaller than our sun. Distance is a factor when comparing the way objects in space appear to us on Earth. The sun is a medium-sized star that looks enormous from Earth. Yet the sun is smaller than many of the stars that appear as tiny points of light in the night sky.
- Severe weather events occur randomly. Each type of severe weather requires specific conditions that occur only in certain places. For example, hurricanes are fueled by warm ocean water. As a result, they form over warm oceans. This is why coastal cities of eastern Texas have histories of hurricane damage, whereas inland cities of western Texas do not.

Original Text: Preview the Topic

In this topic, students learn about plants and animals. First, in Experience 1, they identify the roots, stems, leaves, flowers, fruits, and seeds of plants and compare how those structures help different plants meet their basic needs for survival.

Then, in Experience 2, they learn about and compare how the structures and behaviors of animals help them find and take in food, water, and air, and explore how being part of a group helps animals obtain food, defend themselves, and cope with changes. Finally, in Experience 3, students explore the life cycles of a frog and a butterfly.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon video that shows how bees and plants interact and how bees communicate to other bees where to find a food source. Through this, students explore different parts of plants and animals and how animals benefit from living in groups. As students progress through the experiences, they will answer the Anchoring Phenomenon question, How does being part of a hive help a bee survive?

Teacher Background

Watch the Teacher Background video Plants and Animals to refresh your knowledge of topic content. Key concepts to support instruction of this topic include:

- Most plants have roots, stems, leaves, and flowers that help them meet their basic needs. The structures of the parts vary in different kinds of plants.
- Flowers are the plant part that enable the plant to produce new plants.
- The flowers of some plants grow fruits, which encase and protect their seeds.

- Animals use structures and behaviors to find food and to get water and air.
- Living in groups can help animals find food and protect them.
- Some animals, such as the butterfly and the frog, have unique life cycles.

Updated Text: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about how organisms interact with each other and with their environments. First, in Experience 1, they identify differences in environments and describe how the physical characteristics of environments support the plants and animals in an ecosystem. Then, in Experience 2, they explain and demonstrate how some plants depend on other living things, wind, or water for pollination and seed dispersal. Finally, in Experience 3, they describe the purpose of a food-chain model, identify producers and consumers in a food chain, and then create food chains to demonstrate the dependence of animals on other living things.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon video about how the prickly pear cactus helps the animals in a desert. As students progress through the experiences, they will answer the Anchoring Phenomenon question, How does the prickly pear cactus help the Texas desert ecosystem?

Teacher Background

Watch the Teacher Background video *Organisms and Environments* to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- The basic needs of living things are met through interactions with each other and with their physical environment.
- In order to reproduce, some plants depend on animals, wind, or water to distribute their pollen and seeds.
- The physical characteristics of an environment, such as the amount of rainfall, help determine the plants and animals that can live in that ecosystem.
- Plants and animals within an ecosystem interact through a food chain, a series of interconnected relationships between producers and consumers.

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address them as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- An animal's home is the same as its habitat. An animal's home gives it shelter and a place to have its young. The animal's habitat, on the other hand, supplies air, food, shelter, space, and water.
- Organisms placed higher in a food chain eat everything below them on the chain. Consumer organisms may eat many different types of organisms below them, but many consumers only eat one or a few types of organisms.

Updated Text: Preview the Topic

In this topic, students learn about how organisms interact with each other and with their environments. First, in Experience 1, they identify differences in environments and describe how the physical characteristics of environments support the plants and animals in an ecosystem. Then, in Experience 2, they explain and demonstrate how some plants depend on other living things, wind, or water for pollination and seed dispersal. Finally, in Experience 3, they describe the purpose of a food-chain model, identify producers and consumers in a food chain, and then create food chains to demonstrate the dependence of animals on other living things.

As you progress through the topic, connect the activities back to Topic 6, Plants and Animals. Students can apply what they learned about plant structures, animal structures, animal behaviors, and groups (TEKS 2.13B, 2.13C) with how physical characteristics of environments support plants and animals and food chains in Topic 7 (TEKS 2.12.A, 2.12.B). They can also use what they learn about butterfly life cycles in Topic 6 (TEKS 2.13D) with how plants depend on living things for pollination (TEKS 2.12C).

PREVIEW ANCHORING PHENOMENON

Original Text: Support for Students Some students may have difficulty seeing the individual plants and animals and the information for each. Enlarge the pictures and have students place them in two piles, one for the dry environment and one for the wet environment.

Updated Text: SPECIAL NEEDS: Visually Impaired Some students may have difficulty seeing the individual plants and animals and the information for each. Enlarge the pictures and have students place them in two piles, one for the dry environment and one for the wet environment.

STRIVING: Role Playing(/bold) Have students take on the role of a nature guide that is describing each of the environments and what plants and animals live there. Encourage them to use their own words and vocabulary from the Experience as they discuss the environments and organisms.

Component: *Grade 2 Teacher Guide*

ISBN: 9781323223338

Current Page Number(s): 204

Location: Topic 7, Experience 2, At-A-Glance; Objective

Original Text: Objective

Students will explain and demonstrate how some plants depend on other living things, wind, or water for pollination and to move their seeds around.

Updated Text: Objectives

Students will explain and demonstrate how some plants depend on other living things, wind, or water for pollination and to move their seeds around.

Students will record data using pictures or words to tell what they observe about what moves different kinds of seeds.

Component: *Grade 2 Teacher Guide*

ISBN: 9781323223338

Current Page Number(s): 208

Location: Topic 7, Experience 2, Differentiated Instruction

Original Text: Support for Students Show students the different types of seeds. Explain that they will use properties such as seed size, weight (by feel), and texture to determine whether each seed will travel best by wind, water, or fur. If students have vision impairments and are unable to see the seed details, allow extra time for them to hold and feel the seeds to evaluate their characteristics.

Updated Text: STRIVING Show students the different types of seeds. Explain that they will use properties such as seed size, weight (by feel), and texture to determine whether each seed will travel best by wind, water, or fur.

SPECIAL NEEDS If students have vision impairments and are unable to see the seed details, allow extra time for them to hold and feel the seeds to evaluate their characteristics.

CHALLENGE Have interested students make models of three different seeds—one that is scattered by wind, one by water, and one by animals.

Original Text: A mindset is a personal attitude toward something. Scientists and engineers have some common mindsets. One of the most important is a growth mindset. Those with a growth mindset believe that they can always be better. Those with a fixed mindset think differently. They believe that talent, not effort, is important. They think they are not able to learn and move on from failure. Scientists and engineers are resilient. Resilient people don't let things get them down. When things don't go their way, they try again. They know that the answer is not always as important as the process to get to the answer. This is what scientists call a productive struggle, and it shapes how we learn and grow. Those who wonder about the world and want to learn more about it have curiosity. Curiosity drives scientists to ask questions. These questions often lead to other questions. Curious engineers wonder about how to solve problems. They like to investigate and explore. They also like to observe things to learn more about them. Perseverance is the ability to resist giving up. It is important for scientists and engineers to persevere. When they persevere, they can solve problems. They can keep working until they are satisfied with the result.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 530 of 3538

Original Text: When you take part in science, you understand the world better. During science investigations, you gather evidence and look for patterns.

People who study science are called scientists. Scientists explore the world through investigations. They are curious about the world around them. Scientists ask questions. They want to learn more. As scientists explore, they answer their questions and ask new ones. There are many types of scientists. Different types of scientists focus their studies on certain areas. A plant scientist is called a botanist. A scientist who studies motion and forces is called a physicist. You are a scientist too!

Engineers create or build solutions to problems. They create and build products. There are different types of engineers. Aerospace engineers create objects that fly into space. Biomedical engineers create medical devices. Doctors and nurses use these devices to help others. You are also an engineer!

Updated Text: Who Are Scientists and Engineers?

Science is the search for knowledge. It is coming to understand how the natural world works. When you take part in science, you understand the world better. During science investigations, you gather evidence and look for patterns.

People who study science are called scientists. Scientists explore the world through investigations. They are curious about the world around them. Scientists ask questions. They want to learn more. As scientists explore, they answer their questions and ask new ones. There are many types of scientists. Different types of scientists focus their studies on certain areas. A plant scientist is called a botanist. A scientist who studies motion and forces is called a physicist. You are a scientist too!

Engineering is applying science to solve problems. You use what you have learned in science to help you. You use your science skills to solve problems.

Engineers create or build solutions to problems. They create and build products. There are different types of engineers. Aerospace engineers create objects that fly into space. Biomedical engineers create medical devices. Doctors and nurses use these devices to help others. You are also an engineer!

Location: Student Edition, Unit 1 Week 3, Activity 1, Scientific and Engineering Practices article text (PDF pg. 1)

Original Text: Do you wonder how scientists know so much about the world? They use skills that we all have. They use these skills in special ways. These skills are called scientific and engineering practices.

Scientists decide on what they want to know. Then, they begin to learn about the world. They solve problems based on things they observe. They solve problems based on information they get from models, texts, or other investigations. Scientists and engineers often work in groups. They try to investigate new answers to questions. They also try to find new ways to solve problems.

Updated Text: (The article was re-edited to more closely align with the teacher edition.)

Have you ever wondered how scientists and engineers know so much about the world? They use the same skills that you do. They use these skills in special ways. In science, these skills are known as science and engineering practices. Learning more about the world takes a big first step for scientists and engineers. They have to decide what they want to learn about. They have to use their skills. They use the skill of asking questions. They use the skill of defining problems. To do these things, they have to use more skills. They make observations. They gather evidence. They get their information from models, texts, or investigations. They do all this to find a question they want to learn more about, or a problem they want to solve. Then, scientists and engineers get to work. They work alone or in groups. They investigate new answers to questions, and new ways to solve problems.

Current Page Number(s): 20

Location: Teacher Edition, Unit 3, Activity 5, Student Driven Inquiry (PDF Pg. 3.20)

Original Text: Student-Driven Inquiry

Direct students to the Student-Driven Question Board they created during the Engineering Design Scenario introduction.

Discuss:

Which of these questions do you already have ideas about?

What evidence can you use from your current or previous science lessons to form your ideas?

What evidence can you use from your own life to help you form your ideas?

Do you think your ideas will be the same or different by the end of the unit? Why? (Answers may vary but could include students knowing that wax has to change color, shape, and size to create an effective model, and that these changes are done by using different tools. Students should be using evidence from their student edition and discussions from prior activities. Students may or may not think their ideas will be the same by the end of the unit.)

Remind students that they have already planned an investigation to turn wax into a convincing model and addressed questions related to the materials and processes needed to turn wax into a convincing model.

Ask: What are some ideas we already have about using our plan to create our model? Why? (Answers could include that having a plan will help students make all the necessary changes to the wax to make a convincing model.)

Discuss: What should we do next to find out more about turning wax into a convincing model. Why? (Answers should include questions from the Student-Driven Question Board.)

Note: If students have a hard time choosing an appropriate next step, use the discussion provided or one similar to guide students to the idea that they should use their design plan to create their model.

What was the focus of our last activity?

How did we intend to use the plans we created?

How will these plans help us complete the unit?

What should our next step be?

Updated Text: Student-Driven Inquiry

Remind students that they have already planned an investigation to turn wax into a convincing model and addressed questions related to the materials and processes needed to turn wax into a convincing model.

Ask: What are some ideas we already have about using our plan to create our model? Why? (Answers could include that having a plan will help students make all the necessary changes to the wax to make a convincing model.)

Page 550 of 3538

Current Page Number(s): 3.23

Location: Teacher Edition, Unit 3, Activity 6, Student Driven Inquiry (PDF Pg. 23)

Original Text: Student-Driven Inquiry

Direct students to the Student-Driven Question Board they created during the Engineering Design Scenario introduction.
Discuss: Which of these questions do you already have ideas about? What evidence can you use from your current or previous science lessons to form your ideas? What evidence can you use from your own life to help you form your ideas? Do you think your ideas will be the same or different by the end of the unit? Why? (Answers may vary but could include questions that have already been addressed, such as: Can wax change? How does wax change? When does wax change?)
Explain to students that they will be working on questions related to the question, "What are wax models and why are they used?"

Ask: Do you have any prior experiences related to the question?

Original Text: Using your questions about the phenomenon and what you learned from Bell's example from the article, work with your partner to determine the purpose of our push investigation and write it on the lines provided. (Answers will vary. Example: The purpose of this investigation is to determine how the strength of a push or a pull affects how an object moves.)

Updated Text: (The first question in the student edition was added to the answer key with a sample student response.)

What was the purpose of Alexander Graham Bell's investigation? Use evidence from the article to support your answer. (The purpose of Alexander Graham Bell's investigation was to make the telephone better. Line four of the article says that Bell wanted to make the telephone better even though it had already been invented.)

Using your questions about the phenomenon and what you learned from Bell's example from the article, work with your partner to determine the purpose of our push investigation and write it on the lines provided. (Answers will vary. Example: The purpose of this investigation is to determine how the strength of a push or a pull affects how an object moves.)

Original Text: Student-Driven Inquiry

1. Direct students' attention to the Student-Driven Question Board they created during "Phenomenon Introduction."
2. Discuss: Which of these questions do you already have ideas about? What evidence can you use from your current or previous science lessons to form your ideas? (Answers will vary but could that sounds can be made in different ways and many objects can make sounds.)
3. Remind students that the ideas on the Student-Driven Question Board will help guide their learning for the week.

Directions: Make a prediction about whether you think the sun and moon are the same or different, then compare and contrast the images of the sun and moon, as seen from Earth, in the space provided. Use your comparisons to answer the question.

Do you think the sun and moon are the same? Why or why not? Answers will vary and could include that students think the sun and moon are the same or different. Reasoning could include noticing similarities in shape or differences in appearance.

Original Text: The Moon

he moon is a round and rocky object. It is not a star like the sun. There are many planets with moons. However, Earth's moon is the moon people are usually talking about when they say "the moon." The surface of the moon is not like the surface of Earth. It is rocky like the Earth. However, it does not have water or air around it. Without the air around it, lots of space objects crash into the moon. These crashes make craters of many sizes on the moon's surface. It is because of the craters that the surface of the moon is not smooth. The moon gives off very little heat. It also gives off no light of its own. It may seem to glow many nights out of the month. However, the moon does not make light.

Original Text: Animal Helpers

Wind and water aren't always the best ways to create seeds. That's where animals help. Some animals collect the sticky substance from the stamen of plants. They transport that substance to other flowers, where it might help the plant grow seeds. Animals do not know they're pollinating plants. They are actually drawn to the colorful petals and a sweet substance found in the center of flowers called nectar. As animals, such as insects and birds, search for nectar, the sticky substance clings to their fur or feathers. As they move to other flowers, some of the sticky substance falls off. Some animal helpers drink nectar from many different kinds of flowers. This helps pollinate many different flowers. Some animal helpers only collect nectar from one or two kinds of flowers. These animals can only pollinate one or two kinds of flowers.

Original Text: Activity 10: Raccoons

Raccoons learn where water is when they are young. They stay close to where the water is. Raccoons have great eyesight. It helps them to see water from high up in trees. They drink water by leaning over the water and lapping it up with their tongues. Raccoons eat plants. They also eat small animals such as fish, frogs, turtles, and rabbits. Raccoons hunt at night. At night, it is cool in the desert. They have dark rings around their eyes. The rings help them to see more clearly in the dark. Raccoons find food with their powerful noses. They can also catch fish by simply putting their hands in the water and sensing the vibrations. Raccoons often get their hands wet before eating. Their wet five-fingered paws have an increased sense of touch. This helps them move and tear their food easily. Raccoons do not need to find air. They can breathe freely with their lungs.

Updated Text: (The second to last sentence was changed to say tear their food more easily.)

Activity 10: Raccoons

Raccoons learn where water is when they are young. They stay close to where the water is. Raccoons have great eyesight. It helps them to see water from high up in trees. They drink water by leaning over the water and lapping it up with their tongues. Raccoons eat plants. They also eat small animals such as fish, frogs, turtles, and rabbits. Raccoons hunt at night. Original Text: collaborate: to work together in a group to create a shared artifact

engineer: someone who applies their scientific knowledge to create and build machines that solve problems

engineering: the process of using science in practical applications to solve problems

mindset: a personal attitude toward something

phenomenon: facts or situations that are observed to exist or happen

safe practices: actions, lab procedures, and the use of personal protective equipment that help keep science learning safe

science: the systematic study of the structure and behavior of the natural and physical world through observation and investigations

scientist: someone who studies science

tool: a device used to solve a problem

Updated Text: (An asterisk was added to each vocabulary with a note explaining its meaning at the end.)

collaborate*: to work together in a group to create a shared artifact

engineer*: someone who applies their scientific knowledge to create and build machines that solve problems

engineering*: the process of using science in practical applications to solve problems

mindset*: a personal attitude toward something

phenomenon*: facts or situations that are observed to exist or happen

safe practices*: actions, lab procedures, and the use of personal protective equipment that help keep science learning safe

science*: the systematic study of the structure and behavior of the natural and physical world through observation and investigations

Original Text: Student-Driven Inquiry

1. Explain to students that you noticed something interesting about the gelatin you made the first day of the unit.
2. Present the set gelatin to students, and have them make observations.
3. Allow students to share their observations and record their responses on the board.
4. Direct students to the Student-Driven Question Board they created during the Phenomenon Introduction.
5. Ask: Which questions or questions can we explore to find out more about your observations of the gelatin?
 - a. Guide students toward questions related to how temperature affects texture and flexibility.
6. Direct students to follow the directions in their student edition for the first question.
 - a. Assess students' listening comprehension by ensuring they are completing the task as directed. Provide support to struggling students by repeating the directions and having students restate the expectations back to you in their own words. [ELPS 2I]
7. Have one or two students share their responses with the class.
 - a. Encourage students to speak using grade-level content area vocabulary, and provide sentence starters or other resources, such as word walls, vocabulary cards, and word banks, as needed. [ELPS 3D]

Updated Text: (Three steps were added to this activity to provide more guidance and practice regarding temperature as a property of matter.)

Student-Driven Inquiry

1. Explain to students that you noticed something interesting about the gelatin you made the first day of the unit.
2. Present the set gelatin to students, and have them make observations.
3. Allow students to share their observations and record their responses on the board.
4. Direct students to the Student-Driven Question Board they created during the Phenomenon Introduction.
5. Ask: Which questions or questions can we explore to find out more about your observations of the gelatin?
 - a. Guide students toward questions related to how temperature affects texture and flexibility.
6. Direct students to follow the directions in their student edition for the first question.
 - a. Assess students' listening comprehension by ensuring they are completing the task as directed. Provide support to struggling students by repeating the directions and having students restate the expectations back to you in their own words. [ELPS 2I]
 - b. As you circulate, listen for students who share responses related to the effects of temperature to share with the class.
7. Have one or two students share their responses with the class.
 - a. Encourage students to speak using grade-level content area vocabulary, and provide sentence starters or other resources, such as word walls, vocabulary cards, and word banks, as needed. [ELPS 3D]
 - b. Explain to students that items can also be classified by their temperature.
 - c. Have students create a list of things that are relatively cold and those that are relatively hot.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 605 of 3538

Original Text: Reading to Learn

1. Remind students that they learned the words “solid” and “liquid” in their last activity while describing the gelatin they were making.
2. Ask: What is a solid? (A solid is an object that is firm, stable, and has its own shape.)
3. Ask: What is a liquid? (A liquid is an object that flows freely and takes the shape of its container.)
4. Direct the students to the article in their student edition.
5. Prior to reading the article, have students underline or highlight the sight words and/or spelling patterns they already know. [ELPS 4C]
6. Have students read the article independently, in pairs, or as a class.
 - a. As students come upon unfamiliar words, prompt students to identify familiar spelling patterns or chunks of the word that they already know. If a student cannot identify a familiar portion of the word, provide support by modeling or having a peer model how to decode the word. [ELPS 4C]

Updated Text: (Two steps were added to provide additional teacher support in using an English Language Proficiency Standard.)

Reading to Learn

1. Remind students that they learned the words “solid” and “liquid” in their last activity while describing the gelatin they were making.
2. Ask: What is a solid? (A solid is an object that is firm, stable, and has its own shape.)
3. Ask: What is a liquid? (A liquid is an object that flows freely and takes the shape of its container.)

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 606 of 3538

Current Page Number(s): 5.19-5.20

Location: Teacher Edition, Unit 5, Activity 4, "Collaborative Learning", Steps 1-3e (PDF pg. 19-20)

Original Text: 1) Direct the students to follow the directions in their student editions to record their predictions of stability and change when each pair of objects collides or touches and then their observations after they investigate.

a) If students do not predict or observe anything staying stable or nothing changes (one or the other) in an instance, they can leave the space blank or write "none."

2) As you circulate, observe or take anecdotal data monitoring students' understanding of the following ideas:

a) When the balls go down the ramp and collide, a change can be witnessed in the shape of the ball because of their speed. This change in shape may be hard to see but could be seen with a slow motion video.

b) When the balls simply touch, a change in shape would be nearly impossible to see with eyes in real time or in a slow motion video.

Updated Text: 1) Direct the students to follow the directions in their student editions.

a) Students should record their predictions of stability and change when each pair of objects collides or touches and then their observations after they investigate.

b) Encourage students to use the vocabulary of "cause" and "effect" as they complete the activity.

c) If students do not predict or observe anything staying stable or nothing changes (one or the other) in an instance, they can leave the space blank or write "none."

2) As you circulate, observe or take anecdotal data monitoring students' understanding of the following ideas:

a) When the balls go down the ramp and collide, it causes a change in the shape of the ball because of their speed. This effect (change in shape) may be hard to see but could be seen with a slow motion video.

b) When the balls simply touch, a change in shape would be nearly impossible to see with eyes in real time or in a slow motion video.

Original Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

The student knows that matter has physical properties that determine how it is described, classified, and used.

Updated Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

Recurring themes and concepts. The student uses recurring themes and concepts to make connections across disciplines.

Note: Content for TEKS 1 to 5 appears within all other Units. Examples are provided in the Texas Essential Knowledge and Skills section and detailed in correlations.

Component: *Teacher Textbook - Grade 2 Science*

Location: Text

Original Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

The student knows that matter has physical properties that determine how it is described, classified, and used.

Updated Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

Recurring themes and concepts. The student uses recurring themes and concepts to make connections across disciplines.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Note: Content for TEKS 1 to 5 appears within all other Units.

Current Page Number(s): Page 10

Location: Add the following sentence after first paragraph of Scientific method section

Original Text: N/A

Updated Text: Discuss the results with the students. Ask students what they expected to happen with their experiment if their prediction was correct. For example, the ice cubes melted in the glass in the Sun as it was all liquid, but not in the glass in the shade where there were solid ice cubes in the glass. What actually happened? Does this evidence support their prediction? They should summarize using quantitative and descriptive words.

Original Text: N/A

Updated Text: Idea Boxes

Idea boxes placed throughout the chapter text function to provide opportunities for collaborative discussion of content, review of content introduced, and focus on certain content that is harder to grasp. Guidance on how to use the idea boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by:

- Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support).
- Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box.
- Planning to have at hand any materials needed to implement the Idea box.
- Reviewing the task information contained within the Idea boxes.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

1. Separate single list into 3 separate tables. First table is for science and engineering practice TEKS. Second table is for recurring theme TEKS. Third table is for content TEKS.
2. Inclusion of an explanation of each student expectation in the column titled "Explanation of the TEKS."
3. Added a column titled "Focus" indicating if this is the first time students are learning the student expectation or if it is a re-introduction of the student expectation.
4. Added 2 columns on vertical alignment. One column is for grade 2 TEKS and one column is for Grade 4 TEKS.

Download PDF file under heading "Investigation Standards PDF." Open the file. New content is under the heading "Alignment with Science TEKS." The changes are:

1. Separate single list into 3 separate tables. First table is for science and engineering practice TEKS. Second table is for recurring theme TEKS. Third table is for content TEKS.
2. Inclusion of an explanation of each student expectation in the column titled "Explanation of the TEKS."
3. Added a column titled "Focus" indicating if this is the first time students are learning the student expectation or if it is a re-introduction of the student expectation.
4. Added 2 columns on vertical alignment. One column is for grade 2 TEKS and one column is for Grade 4 TEKS.

Original Text: Follow all class safety rules as you carry out your plan. In addition, be sure to:

- Wear sanitized safety goggles during setup, while collecting data, and when you clean up.
- Be careful when handling batteries—they can get hot and burn your skin.
- Never put batteries in your mouth or on your tongue.
- Wash your hands with soap and water when you are done cleaning up.

Updated Text: Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Always wear rubber gloves when handling wires/batteries
- Be careful when handling batteries—they can get hot and burn your skin.
- Never put batteries in your mouth or on your tongue.
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Let your teacher know if any materials got broken during your investigation.
- Return your supplies to the supply area.

Original Text: Follow all class safety rules as you carry out your plan. In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Keep the electrical equipment away from water sources to prevent shock.
- Be careful when handling the heat lamp and bulb. The bulb can shatter if dropped and can cut skin; if the bulb breaks, tell your teacher immediately so he or she can clean up the pieces.
- Do not touch the bulb when it is on or for several minutes after turning it off, because lightbulbs can get very hot and burn skin.
- Wash your hands with soap and water when you are done cleaning up.

- Wear safety glasses during setup, data collection, and cleanup.
- Be careful when using the hot glue gun. The tip can get hot and can cause burns if touched.
- Hobby snippers should only be used under supervision. Incorrect use of the hobby snippers can lead to severe cuts.
- Wash your hands with soap and water when you are done cleaning up.

Updated Text: Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Wear heat-insulated gloves when handling hot glue or hot water.
- Be careful when using the hot glue gun. The tip can get hot and can cause burns if touched.
- Keep your eyes safe! Always wear safety goggles when sand/powder is present in the work area.
- Only use sharp tools with your teacher's supervision (e.g. safety box cutters, snippers, scissors, wire cutters)
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Return your supplies to the supply area.
- Return your safety goggles to the place where they are stored in your classroom.

Original Text: Safety Note

Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment like goggles are kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, while collecting data, and when you clean up.

Wash your hands with soap and water when you are done cleaning up.

These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Handle liquids with care. Always wear gloves, a lab coat/apron, and safety goggles when handling liquids.
- Wear heat-insulated gloves when handling hot glue or hot water.
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Let your teacher know if any materials got broken during your investigation. Do not touch broken glass.
- Return your supplies to the supply area.
- Return your safety goggles to the place where they are stored in your classroom.

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Original Text: Progress check

Updated Text: Updated the third activity of the reflect stage in the following ways:

1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:

The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. 3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:

The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Original Text: Progress check

Updated Text: Updated the third activity of the reflect stage in the following ways:

1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunityfor students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Link to Updated Content:

[View Updated Content](#)

Original Text: You are now ready to write a report to share what you did and what you figured out during this investigation. Your report can be no longer than two pages in length. You need to divide your report into three sections:

Introduction—this is where you need to tell the reader what you were trying to figure out and why.

Method—this is where you need to describe what you did to answer the guiding question and why.

Argument—this is where you need to share what you figured out through an evidence-based argument.

You can write a draft of your investigation report on your handout or in a new Google Docs or Microsoft Word file.

In your report, you want to demonstrate your understanding of the types of energy and identify everyday examples of energy, including sound, mechanical, light, and thermal energy. You also want to describe the scientific practices, such as making and using tree maps and concept maps, that you used to plan and conduct this investigation. You can also describe the safety practices you used during the investigation if your group went outside.

You also want to make sure to use any of the unfamiliar words that you circled and defined from earlier in the investigation. You also may want to use any important vocabulary words from the readings earlier in this investigation. If your class has a word wall or you keep a list of new words in your notebook, check to see if you can use any of those words when you are writing your draft report.

When you are finished writing, let your teacher know that you are ready to move on to the next activity.

Original Text: The ADI instructional model (Sampson et al., 2009, 2011, 2014, 2015; Sampson & Gleim, 2009; Sampson & Walker, 2012; Walker et al., 2011) was created using the most up-to-date findings on learning and then tested and refined through university-based research in partnership with school districts throughout Texas. As part of this development process, the instructional model was the focus of numerous studies (see Research on ADI) that took place in actual classrooms over a period of ten years. This instructional model is intended to serve as a guide or a template for creating meaningful, rigorous, and equitable 3D science investigations (such as the ones included in these instructional materials). When teachers use these investigations inside their classrooms, their students not only have an opportunity to learn new SCIs, RTCs, and SEPs that are found in the revised TEKS as they figure out how or why something happens, but they are also encouraged to use SCIs, RTCs, and SEPs that they learned during prior investigations (or grades) as part of the process. Each investigation also has the following features:

Updated Text: The ADI instructional model (Sampson et al., 2009, 2011, 2014, 2015; Sampson & Gleim, 2009; Sampson & Walker, 2012; Walker et al., 2011) was first created using the most up-to-date findings about how people learn and then tested and refined over time through university-based research in partnership with school districts throughout Texas. As part of this development process, the instructional model was the focus of numerous studies (see Research on ADI) that took place in actual classrooms over a period of ten years. This instructional model is intended to serve as a guide or a template for creating meaningful, rigorous, and equitable 3D science investigations or design challenges. When teachers use these investigations inside their classrooms, their students not only have an opportunity to learn new DC, RTCs, and SEPs that are found in the revised TEKS as they figure out how or why something happens, but they are also encouraged to use DC, RTCs, and SEPs that they learned during prior investigations (or grades) as part of the process. Each investigation also has the following features:

Original Text: This instructional model includes seven stages of classroom activity (see image below). These seven stages of the instructional model provide a structure that supports students as they investigate a phenomenon, make sense of

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 695 of 3538

that phenomenon, and evaluate and refine ideas, explanations, or arguments (NRC, 2012). ADI also provides an authentic context for students to develop fundamental literacy skills and to learn or apply mathematical concepts and practices. Finally, and perhaps most importantly, these investigations create a language rich learning environment that enables emerging multilingual students to acquire a new language as they learn science.

Updated Text: This instructional model includes seven stages of classroom activity (see image below). These seven stages of the instructional model provide a structure that supports students as they make sense of a phenomenon or problem, create an explanation or solution, share arguments to support the validity or acceptability of these explanations or solutions, and then refine these explanations, solutions, and arguments based on feedback (NRC, 2012). ADI also provides an authentic context for students to develop fundamental literacy skills and to learn or apply mathematical concepts and practices. Finally, and perhaps most importantly, these investigations and design challenges create a language rich learning environment that enables emerging multilingual students to acquire a new language as they learn science.

[View Updated Content](#)

Original Text: The first activity of this stage of an investigation begins with the introduction of a phenomenon to create a need for students to figure something out. A phenomenon is simply an observable event. The phenomenon will usually be in video format. Students should be encouraged to record what they noticed and wonder about the phenomenon as they watch the video introduction in the task stage handout (see image at right). The students should then be given an opportunity to share their observations and questions with the rest of the class. At this point, students are interested and want to know more about the phenomenon.

Updated Text: The first activity of this stage of an investigation begins with the introduction of a phenomenon or a problem to solve. This introduction of a phenomenon or problem at the beginning of the investigation or design challenge creates a need for students to figure something out. The phenomenon or problem to solve will usually be presented to student in video format. Students should be encouraged to record what they noticed and wonder about the phenomenon or problem as they watch the video introduction in the task stage handout (see image at right). The students should then be given an opportunity to share their observations and questions with the rest of the class. At this point, students are interested and want to know more about the phenomenon or problem.

We recommend students be given opportunities to share with the full class the things they wonder about in response to the phenomenon. These wonderings can be written on a sheet of chart paper or on the whiteboard and displayed as a Wonder Wall—a specific place to document the scientifically oriented questions students pose in response to the phenomenon. A Wonder Wall ensures that all students questions about the phenomenon are acknowledged as valid and their contributions to class discourse are valued. The Wonder Wall also provides resources for extension activities for students in the Do and Share stage.

[View Updated Content](#)

Original Text: The students are given an opportunity to share what they already know about the phenomenon during the third activity of this stage. Students begin by drawing a picture that shows what they know about the phenomenon (or in some cases a related phenomenon that is more familiar to them). They should also be encouraged to use words to help explain their ideas or thinking as part of the picture. This activity is important because students' prior knowledge and experiences related to the phenomenon can be used as a starting point for student sense-making. Teachers can then leverage the prior knowledge and experiences of the students in their classes as a tool to help students figure out how or why something happens in the world around them. This stage also provides multiple opportunities to practice, develop, and demonstrate mastery of the following grade-level SEPs as outlined in the TEKS:

Updated Text: The students are then given an opportunity to share what they already know about the phenomenon or the problem during the third activity of this stage. Students begin by drawing a picture to illustrate what they know about the phenomenon or the problem on the task stage handout (see image at right). They should also be encouraged to use words to help explain their ideas or thinking as part of the picture.

Once all the students have drawn and labeled a picture (which is a basic conceptual model of their thinking), they should be given time to share their ideas with the other students in their group. As they share their ideas, they will start asking more questions about the phenomenon and begin to think about what else they will need to know before they will be able to answer the guiding question. Finally, each group of students should be encouraged to generate a list of at least three things that they will need to learn more about during the investigation.

Original Text: The second activity of the report stage gives students an opportunity to review the reports in pairs using the peer-review guide and teacher scoring rubric (PRG/TSR; see images below). The PRG/TSR contains specific criteria that are to be used by a pair of students as they evaluate the quality of each section of the investigation report as well as the quality of the writing. There is also space for the reviewers to provide the author with feedback about how to improve the report. Once a pair of students finishes reviewing a report as a team, they are given another report to review. When students are grouped together in pairs, they only need to review two different reports. Be sure to give students only 15 minutes to review each report (we recommend setting a timer to help manage time). When students are grouped into pairs and given 15 minutes to complete each review, the entire peer-review process can be completed in 30 minutes (2 different reports × 15 minutes = 30 minutes).

Updated Text: The second activity of the report stage gives students an opportunity to review the reports in pairs using the peer-review guide and teacher scoring rubric (PRG/TSR; see images below). The PRG/TSR is designed as an analytical rubric that makes the criteria for mastery of the task explicit. It contains four sections. One section focuses on the introduction of the report, one section focuses on the method, one on the argument, and one on the overall writing mechanics. Each section contains specific criteria that are unique to each section of the report. These criteria are framed as questions that can be answer with an answer of "yes" (meets expectations for that criterion), "somewhat" (approaches expectations for the criterion), or "no" (does not meet expectations for that criterion). The pair of students can simply answer each question as they evaluate the quality of each section of the report as well as the quality of the writing. There is also space for the reviewers to provide the author with feedback about how to improve the report. Educational research suggests analytical rubrics are particularly effective for promoting growth throughout the year, as the norms for what counts as quality consistently evolve with students increased knowledge and skill. This type of rubric stands in contrast to a rubric normed against a static standard of performance. A rubric with a specific standard as the end goal cannot provide continued opportunities for growth once students meet the standard used to develop the rubric. Research also shows that analytic rubrics are effective for focusing students attention on important questions, such as the quality of evidence, along side details such as font size, neatness, or word count. While these details are important, they tend to be the sole focus of rubrics normed against a static standard of performance.

Once a pair of students finishes reviewing a report as a team, they are given another report to review. When students are grouped together in pairs, they only need to review two different reports. Be sure to give students only 15 minutes to review each report (we recommend setting a timer to help manage time). When students are grouped into pairs and given 15 minutes to complete each review, the entire peer-review process can be completed in 30 minutes (2 different

reports × 15 minutes = 30 minutes).

Link to Updated Content:

[View Updated Content](#)

Original Text: The final activity of the report stage is to revise the report. Each student is required to rewrite their report using the reviewers' comments and suggestions as a guideline. The author is also required to explain what they did to improve each section of the report in response to the reviewers' suggestions in the author response section of the PRG/TSR. Once the report is revised, it is turned in to the teacher for evaluation. The teacher can then provide a score on the PRG/TSR in the column labeled "Teacher Score" and use these ratings to assign an overall grade for the report. This approach provides all students with a chance to improve their writing mechanics and develop their reasoning and understanding of the content. This process also offers students the added benefit of reducing academic pressure by providing support in obtaining the highest possible grade for their final product.

Updated Text: The final activity of the report stage is to revise the report. Each student is required to rewrite their report using the reviewers' comments and suggestions as a guideline. The author is also required to explain what they did to improve each section of the report in response to the reviewers' suggestions in the author response section of the PRG/TSR. This approach provides all students with a chance to improve their writing mechanics and develop their reasoning and understanding of the content. This process also offers students the added benefit of reducing academic pressure by providing support in obtaining the highest possible grade for their final product. Once the report is revised, it is turned in to the teacher for evaluation. The teacher can then provide a score on the PRG/TSR in the column labeled "Teacher Score" and use these ratings to assign an overall grade for the report.

The PRG/TSR, as noted earlier, is designed to be an analytical rubric rather than a holistic one. Analytical rubrics break down the characteristics of an assignment or products into parts, allowing the scorer to itemize and define exactly what aspects are strong, and which ones need improvement (Dlugokienski & Sampson, 2008). Holistic rubrics, in contrast, often list three to five levels of performance, along with a broad description of the characteristics that define each level. The main advantage of an analytical rubric is that it provides targeted feedback to students. We take this one step further and identify the criteria that, when used together, indicates that a student can write a report to share what was figured out during an investigation using DC, RTCs, and SEPs. Thus, a score of two on each criterion (meets expectations) indicates that a student has reached a level of mastery. Each criterion is also phrased as question, rather than a description, to help facilitate scoring and reduce bias. For example, two questions that included in the PRG/TSR are, "do you think the task and the guiding question or clear?" and "Do you think the analysis of the data is correct?" Answering "yes" to one of the these questions indicates that the student meets expectations for that criterion and should be awarded a score of two. Answering "somewhat" or "partially" indicates that a student is approaching expectations for that criterion and should be awarded a score of one. Finally, answering "no" indicates that the student needs improvement or did not include that aspect of the report and should earn a score of zero. Research on this approach not only shows that both students and teachers can review/score a report accurately using the PRG/TSR, but also student's writing improves substantially over time because of what they learn from reviewing other reports and from the targeted feedback they receive on their own report from their peers and their teacher (Sampson et al., 2013; Sampson & Walker, 2012).

Original Text: The image below shows the report grading tool that is embedded into the ADI Learning Hub. To use this tool, teachers can require students to submit the final draft of their investigation report through the ADI Learning Hub. The teacher can read the reports and evaluate each section using the rubric. The teacher can also provide additional feedback to a student if needed. Once the report is graded, students can see their score and any feedback in the investigation dashboard of the ADI Learning Hub.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 700 of 3538

Updated Text: The image below shows the report grading tool that is embedded into the ADI Learning Hub. The report grading tool is the same analytical rubric that is included in the PRQ/TSR described earlier in the implementation guide. Analytical rubrics break down the characteristics of an assignment or products into parts, allowing the scorer to itemize and define exactly what aspects are strong, and which ones need improvement (Dlugokienski & Sampson, 2008). The report grading tool included specific criteria that, when used together, indicates that a student can write a report to share what was figured out during an investigation. Thus, a score of two on each criterion (meets expectations) indicates that a student has reached a level of mastery. Each criterion is also phrased as question, rather than a description, to help facilitate scoring and to reduce bias. For example, two of the questions found in the report grading tool include “do you think the task and the guiding question or clear?” or “Do you think the analysis of the data is correct?” Answering “yes” indicates that the student meets expectations for that criterion and should be given a score of 2, answering “somewhat” or “partially” indicates that a student is approaching expectations and should be given a score of 1 for that criterion. Answering “no” indicates that the student needs improvement or the student did not complete that aspect of the report and should be given a score of 0. Teachers can also recognize students who exceeded grade level expectations and award a score of 3 on a specific criterion. To use this tool, teachers can require students to submit the final draft of their investigation report through the ADI Learning Hub. The teacher can read the reports and evaluate each section using the analytical rubric. The teacher can also provide additional feedback to a student if needed. Once the report is graded, students can see their score and any feedback in the investigation dashboard of the ADI Learning Hub.

Original Text: N/A

Updated Text: Added the following Text to the Tip for In Person Lesson:

Students do not need to do a "close read" of this text or completely understand all the ideas in it before moving on to the next activity. They will be encouraged to revisit this text later in the investigation when creating their arguments and writing their reports. All students need to be able to do during this activity is to work with the other members of their

group to identify one or two ideas that they think are important to keep in mind or are potentially helpful.

Within the Ideas passages, important words are bolded and defined in text. Often, the definition will be supported by images and an example. These words are good words to include on a word wall or in student vocabulary notebooks. These words are also ones you can suggest students include in their plan, argument, and report where appropriate.

There are many supports for helping students comprehend what they read already embedded into this activity (i.e., activating prior knowledge, providing a shared experience, making connections, synthesizing, and talking with peers). You might not need to provide much extra support. If you are concerned about students understanding this text because of their scores on past reading comprehension tests, you can read it out loud as they follow along. As you read the text out loud, be sure to stop at each important idea and ask the students to put a star (or other annotation) next to it in the margin of their handout. They can then discuss these ideas in their small groups.

This activity provides an opportunity for emerging multilingual students to speak using scientific vocabulary, to internalize new English words, and to build academic vocabulary. We suggest visiting with individual groups and asking students to point out important words in what they read and to define what those words mean during this stage of the investigation.

The end of this activity provides an opportunity to support emerging multilingual students learning and use of (a) basic and academic vocabulary, (b) essential language, (c) basic and scientific language structures, and (d) basic and scientific expressions. While students are talking in their small groups about what they read, you can ask emerging multilingual students to use language they heard other students use. You can also support their learning by making sure to use targeted vocabulary and language structures while speaking to individual groups and the whole class.

Updated Text: Added the following text to the Lesson Plan:

It is important to listen to the conversations of several groups when they are talking over what they read at the end of this activity. Listening to the conversations is an opportunity for formative assessment as students are processing the readings. You should take notes on what students understand and what they remain unclear on. The final activity of this stage provides an opportunity to reteach those concepts students remain unclear about. Taking notes on student conversations will provide information on planning any reteaching that students require.

Location: Unit 2 > Concept 1 > Lesson 6 > Educator Notes > Slide 6, What You Will Do

Original Text: Explain that the purpose of this interactive is to understand the causes of motion and the effects of pushes and pulls. Students will record how a ball hitting a wall changes direction and how gravity causes a ball or object in motion to be pulled toward Earth.

Demonstrate the interactive and then have students verbalize how to manipulate the parts of the interactive.

Updated Text: Explain that the purpose of this interactive is to understand the causes of motion and the effects of pushes and pulls. Students will observe how a ball changes direction during a game of soccer and how gravity causes a ball to be pulled toward Earth. The interactive has two parts. In the first part of the interactive, students will change the number of passes the red team makes before trying to score. They will click on the tiles to change the number of passes. In the second part of the interactive, students will change the numbers of players and the number of passes to explore motion. They will click on the tiles to change the number of passes. Demonstrate the interactive and then have students verbalize how to manipulate the parts of the interactive. Remind students to record the motions and their causes on the graphic organizers.

Original Text: A flowering plant is a plant that uses flowers to reproduce. A conifer is a type of nonflowering plant that uses cones to reproduce. Conifers and flowering plants both make seeds. The seeds of conifers, such as pine trees, develop inside the scales of pinecones. Pinecones release their seeds, which can then grow into new pine trees. But the seeds of flowering plants start out inside flowers.

Updated Text: A flowering plant has flowers. A conifer is a type of nonflowering plant that makes cones, like pinecones, instead of flowers. Conifers and flowering plants both make seeds. The seeds of conifers, such as pine trees, develop inside the scales of pinecones. Pinecones release their seeds, which can then grow into new pine trees. Original Text: Flowering plants reproduce through sexual reproduction. To produce seeds, a flower must be pollinated. Fragrant, brightly colored flowers, filled with sugary nectar, attract bees, butterflies, and even hummingbirds. These pollinators carry pollen from flower to flower. Other plants make flowers that are small and hard to notice. Their pollen is carried by wind.

Original Text: Pollination is followed by fertilization. Fertilization occurs when pollen reaches the female plant parts, causing a seed to form. Each seed has a hard coat and contains the embryo of a new plant. The flower also changes. Its petals dry up and fall off. The base of the flower, which covers the seeds, changes to make them ready for dispersal.

Updated Text: Once a plant is pollinated, new seeds can form through the process of fertilization. Each seed has a hard coat and contains the beginnings of a new plant. The flower also changes. Its petals dry up and fall off. The base of the flower, which covers the seeds, changes to make them ready for dispersal.

Original Text: • What kinds of plants do not have flowers? What kinds do not have seeds? Sample response: Conifers have seeds but no flowers. Ferns and mosses do not have seeds, they have spores instead.

- How do these kinds of plants reproduce? Sample response: Conifers form their seeds inside pinecones. Ferns and mosses make spores that fall to the ground. The spores can grow into new plants.
- What is special about the life cycles of flowering plants? Sample response: Flowering plants need to be pollinated, often by animals. Flowers develop in many different ways to disperse the seed.

- How do these kinds of plants reproduce? Sample response: Conifers form their seeds inside pinecones. Ferns and mosses make spores that fall to the ground. The spores can grow into new plants.
- What is special about the life cycles of flowering plants? Sample response: Flowering plants need to be pollinated, often by animals. Flowers develop in many different ways to disperse the seeds.

Updated Text: • What kinds of plants do not have flowers? What kinds do not have seeds? Sample response: Conifers have seeds but no flowers. Ferns and mosses do not have seeds, they have spores instead.

- What is special about the life cycles of flowering plants? Sample response: Flowering plants need to be pollinated, often by animals. Flowers develop in many different ways to disperse the seeds.

Updated Text: Remind students to complete each graphic organizer after reading each section. Students may also wish to create their own Venn diagrams on a separate sheet of paper, to record examples and descriptions of contact forces, noncontact forces, and both. Monitor students during the exploration to ensure that they are on the right track.

Component: *Science Techbook for Texas by Discovery Education: Grade 3 Unit 3 Teacher Edition*

ISBN: 9781616292041

Current Page Number(s): 52

Location: Setting the Purpose

Original Text: Do a short Eye Spy activity with the image of four waste baskets in the student materials and a stopwatch. During the activity, the students will look at the same image multiple times with different goals. Do not let students look at their materials because you will show them the image for set amounts of time.

- Give students 10 seconds to look at the image.
- Give students 30 seconds to 1 minute to write down what they saw.
- Next, explain to students that you will ask them to describe what is in each waste basket.
- Give students 15 seconds to look at the image again.
- Give students 1 minute to write down what they saw in each waste basket.
- Next, explain to students that you will ask them to decide into which waste basket the following items would go—a used soda can, an apple core, and an old notebook.
- Give students 15 seconds to look at the image again.
- Give students 2 minutes to write down the color or location of the waste basket that should be used for a used soda can, an apple core, and an old notebook.
- Have students share their choices with an elbow partner.

Updated Text: Have students look around the classroom and locate one item or resource that they use in class, such as a piece of paper, a pencil, or desk. Turn off the lights and have students move around the room until you turn the lights on again. Once you turn the lights back on, instruct students to find a partner. Instruct partners to share their items and if they think that the item can be conserved by being recycled, reused, or reduced. Discuss student findings as a class.

Next, gather the class around one of the class waste baskets. Ask students to observe the contents and determine if any of the materials can conserved by being reused, recycled, or reduced. Have students explain their reasoning.

Updated Text: We use natural resources in our everyday lives. Trees, water, air, metals, and fuels are all resources. What would happen if we ran out of a resource? Conservation means not wasting resources. We can conserve natural resources when we reduce, reuse, and recycle materials.

Original Text: Review pronunciation of vocabulary word agriculture in English, calling attention to the prefix agri-. Explain that the prefix comes from the Latin word meaning field. Have students name the base word in agriculture. Explain that culture means to grow and put together. The word means to grow in a field.

Updated Text: Provide students with the word agriculture on a card or paper. Look around the classroom for objects in the environment that begin with the same letters of the word. Afterwards, review the pronunciation of the vocabulary word agriculture in English, calling attention to the prefix agri-. Explain that the prefix comes from the Latin word meaning field. Have students name the base word in agriculture. Explain that culture means to grow and put together. The word means to grow in a field. Environmental print cards can act as signal words to help students remember sound-symbol relationships.

Original Text: The term orbit can be used as a noun or a verb. One object orbits another when it moves around that second object in a repeating path. Planets, moons, asteroids, and meteoroids orbit the sun either alone or as part of a planet–moon system. Studying how objects orbit in our solar system is an excellent opportunity to help students think about identifying and using patterns to explain scientific phenomena or to design solutions. As students work through the unit, encourage them to notice the following:

- Scientists observe patterns in the way that the planets orbit the sun.
- Scientists observe patterns in the way the moon orbits Earth.
- The moon moves through its phases in a predictable pattern each month.

Once students learn more about how the planets and moons orbit in space, they can engage in a similar process to consider identifying and using patterns to explain scientific phenomena or to design solutions.

Updated Text: Constructing solar system models helps us to understand the planets and the sun in space. This is an excellent opportunity to help students think about scale, proportion, and quantity. As students work through the concept, encourage them to notice the following:

- Since the solar system is so large, constructing models of the sun, Earth, and moon helps us to understand their orbits and sizes in relation to one another.
- Models can also help us use units and scales to measure the distance in relation to the sun of each planet in Earth’s solar system.
- Using physical quantities, such as size and temperature, helps us to describe the properties of planets and objects in space.

After students learn more about planets and space, they can engage in a similar process to measure and describe the properties of objects in terms of their size and quantity.

Original Text: Animal life cycles begin inside an egg or inside a parent. A frog or fish might lay thousands of eggs, while an elephant may give birth just a few times in its lifetime. Like plant seedlings, new animals grow and mature until they become able to reproduce themselves. The cycle of life repeats itself again.

Updated Text:

Animal life cycles begin inside an egg or inside a parent. A frog or fish might lay thousands of eggs, while an elephant may give birth just a few times in its lifetime. Like plant seedlings, new animals grow and mature. The cycle of life repeats itself again.

Original Text: Record the materials and their properties in the data table. Sample response:

Craft sticks: lightweight, low volume, not magnetic, floats

Chenille stems: lightweight, low volume, magnetic, floats

Rope: lightweight, low volume, not magnetic, sinks

Cardboard: lightweight, larger volume, not magnetic, floats

As students investigate, circulate around the room to be sure that students are using the tools appropriately and recording the data.

- How do we measure matter? How do we test matter? Sample response: We use tools to measure and test matter. A balance measures mass. A magnet tests magnetism.

Updated Text: Record the materials and their properties in the data table. Sample response:

Updated Text: 1. Did the mass of an objects determine if it would sink or float? In other words, did heavy objects always sink and light objects always float? Explain with examples 2. Now consider the size of an object. Did large objects always sink, and small objects always float? Explain with examples. 3. Which properties (mass, size) contribute to whether an object sinks or floats? Explain with examples.

Updated Text: To communicate your solution, you will act as scientists. Scientists communicate individually with a team in the lab, and then communicate with other scientists at conferences to explain their new understanding or experimental results. Scientists should engage respectfully in scientific discussions. Communicating also involves listening actively to others' explanations to identify relevant evidence.

Updated Text: There are many STEM-related careers that are growing and important to our growing knowledge of the world around us. One STEM career that focuses on living things interacting with each other is an ecologist. Have students use books, magazines, and approved websites to research the role of an ecologist. Create a "one pager" of who an ecologist is and what an ecologist does.

Science, Grade 3

Program: *PhD Science Texas Level 3 Texas Program Bundle (Modules 1-3): TEKS*

Component: *Earth Changes with Spotlight Lessons on Changes in Matter Teacher Edition*

ISBN: 9798885885249

Current Page Number(s): 64

Location: Land, last sentence before the sample anchor chart

Original Text: Replace "update" with "develop": "Work with students to summarize their learning, and then update the anchor chart."

Updated Text: "Work with students to summarize their learning, and then develop the anchor chart."

Component: *Earth Changes with Spotlight Lessons on Changes in Matter Teacher Edition*

ISBN: 9798885885249

Current Page Number(s): 104

Location: Learn: Investigate Water and Land Interactions, paragraph after the inline Safety Note box, last sentence

Original Text: Extra words; remove "the shape of the land and": "Tell students to observe the the shape of the land and components of land in their models and compare their models with the wave model."

Updated Text: "Tell students to observe the components of land in their models and compare their models with the wave model."

Component: *Earth Changes with Spotlight Lessons on Changes in Matter Teacher Edition*

ISBN: 9798885885249

Current Page Number(s): 104

Location: Learn: Investigate Water and Land Interactions, end of the paragraph after the inline Safety Note box and bottom right-side margin

Original Text: Delete sidebar Teacher Note that reads "Although the land in the rain model is flat, students may point out that rain also falls on land that is not flat. Acknowledge students' ideas and confirm that rain interacts with land in many

different locations, including mountainous or hilly areas." Delete corresponding inline icon after the words "and compare their models with the wave model."

Updated Text: Delete sidebar and icon

Component: *Earth Changes with Spotlight Lessons on Changes in Matter Teacher Edition*

ISBN: 9798885885249

Current Page Number(s): 105

Location: Learn: Investigate Water and Land Interactions, top of page 105, second Teacher Question after the inline Safety Note box

Original Text: Remove: "How does the shape of the land in your model compare with the land in the wave model?"

▪ The land in our river model is U-shaped to represent the steep land on either side of a river. The land in the wave model was piled on one side of the bin to represent the shoreline. ▪ The land in our rain model is flatter than the land in the ocean model.

Acknowledge student responses and explain that the three models are different because the shape and components of land near an ocean, a river, and in areas where it might rain are different."

Updated Text: Replace with: "Acknowledge student responses, and explain that the three models are different because the components of land near an ocean, a river, and in other areas where it might rain are different."

Component: *Earth Changes with Spotlight Lessons on Changes in Matter Teacher Edition*

ISBN: 9798885885249

Current Page Number(s): 272

Location: Learn: Complete the End-of-Module Assessment; inline Teacher Note box, first paragraph

Original Text: Insert text after "If selecting student responses, remember to remove identifying information and to select diverse student responses."

Updated Text: "Student responses to item 4a may vary. Possible correct answers include 4, 2, 3, 5, 1; 4, 3, 2, 5, 1; and 3, 4, 2, 5, 1. Note that "Water moves large rocks" is always step 1 and "Water moves small pieces of rock" is always step 5."

Component: *Earth Changes with Spotlight Lessons on Changes in Matter Teacher Edition*

ISBN: 9798885885249

Current Page Number(s): 418

Location: Appendix A, Storyline, Lessons 8-9, Reveal section, second paragraph, second sentence.

Original Text: "First we discuss how the components of land and the shape of land in the river models compare with the wave model."

Updated Text: "First we discuss how the components of land in the river and rain models compare with the wave model."

Component: *Survival and Change Teacher Edition*

ISBN: 9798885885256

Current Page Number(s): 95

Location: Learn: Analyze Daily Weather Conditions, first set of sample student responses, second sample student response

Original Text: sample student response deleted

Updated Text: Delete: "The temperature was highest on Day 2 and lowest on Day 3."

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 748 of 3538

Component: *Survival and Change Teacher Edition*

ISBN: 9798885885256

Current Page Number(s): 235

Location: Learn, Explore Other Butterfly Life Cycles, Sample anchor chart

Original Text: Insert new text before the sample anchor chart:

Updated Text: "Summarize student responses, and update the anchor chart."

Component: *Survival and Change Science Logbook*

ISBN: 9798885885430

Current Page Number(s): iv-vi

Location: Table of Contents

Original Text: A new activity guide needs to be added for Lessons 8 and 20, so the SL will be repaginated after the new activity guide. The Table of Contents needs to be updated with the new page numbers.

Updated Text: Renumber all pages after new Lesson 8 Activity Guide B to end.

Component: *Forces and Motion with Spotlight Lessons on the Solar System Teacher Edition*

ISBN: 9798885885263

Current Page Number(s): 119

Location: Final bullet

Original Text: "How does the length of the ropes on the seat change over time?"

Updated Text: "How does the shape of the seat change over time?"

Reorder the answer choices so that this is the 4th choice, and "How much fun do people have on the seat over time?" is the 5th choice.

Component: *Forces and Motion with Spotlight Lessons on the Solar System Teacher Edition*

ISBN: 9798885885263

Current Page Number(s): 132

Location: Lesson 10, Learn, Explore Changes in Motion

Original Text: The image needs to be deleted to streamline lesson content.

Updated Text: Delete the image of the scooter boards, and revise the sentence above the image being deleted to read, "Show students a scooter board, and ask the class the following question."

Component: *Forces and Motion with Spotlight Lessons on the Solar System Teacher Edition*

ISBN: 9798885885263

Current Page Number(s): 133

Location: Lesson 10, Learn, inline Safety Note. third bullet

Original Text: Formatting; Due to addition of new material added in response to TEA feedback, some existing material needs to be deleted to streamline lesson content.

Updated Text: Replace "When using a scooter board, avoid" with "Avoid"

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Current Page Number(s): p. 61

Location: Column 1, Steps 6–7

Original Text: "... .

Ask them to observe the water as it begins to evaporate and make notes about their observations if desired."

Updated Text: "... . The time required for the water to boil may vary based on the hot plate.

Ask them to observe the water as it begins to boil and evaporate and pay attention to how the water changes. Many students may think that steam is evidence of evaporation. Water vapor, or the gas form of water, is invisible, and is different from steam. Steam is evidence of water in the air condensing and becoming visible. Prompt students to identify boiling as an observable change in the water as it is heated. Water evaporates when it boils. Additional evidence of evaporation would be a decrease in the overall amount of water in the beaker."

Component: McGraw Hill Texas Science, Grade 3 Teacher Edition

ISBN: 9781265517908

Current Page Number(s): 14A

Location: 2nd Column, Make a Plan section

Original Text: Make a Plan

Steps 1–4 To help students select a design, show them photos of bridges and advise them to look for common design features. The amount of materials needed will be an estimate because students may discover that they need more supplies as they begin construction of their bridge. As students construct their bridge, remind them to focus on making the bridge strong so that it can withstand the weight of as many pennies as possible. Students will take pictures of their completed prototype. TEKS 3.1B

- Steps 5–8 Advise students to place the pennies on the bridge carefully instead of dropping them onto the bridge. Students will record results in their data table.
- Steps 9–11 Students evaluate their original bridge design and propose solutions for improvements. Then, they implement their improvements and test the new bridge design. TEKS 3.2D, 3.3A

Communicate Information

Have teams share and communicate their results to the class. What patterns can they identify based on what designs held the most pennies?

Updated Text: Make a Plan/Develop the Design

Steps 1-2 To help students select a design, show them photos of bridges and advise them to look for design features to sketch a plan. Students choose the materials needed to begin the construction of their bridge. As students construct their bridge, remind them to consider all of the factors that will impact the stability of the bridge, including the materials used and the weight of each penny. Students should focus on making their bridge withstand as many pennies as possible. TEKS 3.1B, 3.5G

Steps 3-5 Students will use their sketch to build the prototype according to the requirements. Students will take photos of their completed prototype.

Test the Design/Improve the Design

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 789 of 3538

Steps 6-9 Advise students to carefully place the pennies on the bridge instead of dropping them until it collapses. Students will record results in their data table.

Steps 10-12 Students evaluate their original bridge design and propose solutions for improvements. Then, they implement their improvements, test the new bridge design, and record the results. TEKS 3.2D, 3.3A

Steps 10-12 Students evaluate their original bridge design and propose solutions for improvements. Then, they implement their improvements, test the new bridge design, and record the results. TEKS 3.2D, 3.3A

Communicate the Results

Have teams share and communicate their results to the class. What patterns can they identify based on what designs held the most pennies?

Location: Left column, Example

Original Text: Students might investigate how the placement of the pennies on the bridge affects how many pennies the bridge will hold.

Investigations must answer the explorable question.

Updated Text: 1. Build a stable gumdrop bridge that spans 15 cm using gumdrops, craft sticks, toothpicks, pennies, a ruler, and an index card.

2. Brainstorm and research shapes for a sturdy design to go across a 15 cm gap.

3. Choose a shape and plan how to put it together.

4. Build bridge #1 and test it with washers.

5. Improve the design and build bridge #2 and test it with washers.

5. Record your results in the data table.

Location: Left Column, Guided and Open Options and Guided Inquiry box

Original Text: Guided and Open Options

For guided and open inquiry, students are expected to develop materials lists, write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Guided Inquiry

Provide the explorable question. Ask: How can you make a useful object out of recycled materials?

Example The class might choose to agree on a common purpose or problem and then have student groups design and assemble objects that meet the purpose or solve the problem. Investigations must answer the explorable question.

Updated Text: Structured and Open Options

For structured inquiry, students are given a procedure. For open inquiry, students are expected to develop materials lists,

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 809 of 3538

write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question. Ask: How can you make a useful object out of recycled materials?

Example Step 1. Observe the recycled materials and decide which materials to use to design a new object that will serve a purpose. Step 2. Sketch your design using those materials. Step 3. Build the new object out of the recycled materials selected. Step 4. Test your prototype. Step 5. Adjust prototype for improvements.

Original Text: Yes, I was able to see how animals get what they need from other animals.

Updated Text: Yes, I was able to see how animals get what they need from other consumers and how a consumer gets its energy from producers. For example, both a snail and a mouse are consumers that eat strawberries for energy. However, a consumer, the snake, depends on another consumer, the mouse, for energy.

Original Text: Sample answer: The diagram uses arrows, text, and pictures in a certain order to show how the food chain is organized.

Updated Text: Sample answer: The diagram uses arrows, text, and pictures in a certain order to show how the food chain is organized, but a photo may show a frog about to eat a fly.

Component: McGraw Hill Texas Science, Grade 3 Teacher Edition

ISBN: 9781265517908

Current Page Number(s): 323

Location: 2nd column: Essential Question Check-In

Original Text: Sample answer: All the other members of the food chain could be affected. The animals that follow the organism may not have the food they need, and their numbers would go down. The numbers of the plants and animals that begin the food chain might go down or go up.

Updated Text: Students should infer that some organisms will increase in numbers and some will decrease.

Component: McGraw Hill Texas Science, Grade 3 Teacher Edition

ISBN: 9781265517908

Current Page Number(s): 323

Location: Under Assess, under Claim, Evidence, Reasoning next to Notebooking

Original Text: an ecosystem can be affected by other organisms' numbers going up or down.

Updated Text: Sample answer: an ecosystem can be affected by other organisms' numbers going up or down. Removing organisms can affect much of the food chain. For example, if you remove grass, the number of rats that eat grass decreases. Animals that eat rats would also go down in numbers. But if you remove the rat, the number of grass can increase.

Component: McGraw Hill Texas Science, Grade 3 Teacher Edition

ISBN: 9781265517908

Current Page Number(s): 323

Location: ASSESS, Connect to the Chapter Question, second sentence

Original Text: For example, if the rat were removed from the desert food chain, then the animals that followed in the food chain—the snake and hawk—would not function as a food chain by themselves.

Updated Text: N/A

Component: McGraw Hill Texas Science, Grade 3 Teacher Edition

ISBN: 9781265517908

Current Page Number(s): 333

Location: ASSESS: CER: 2nd sentence

Original Text: some organisms thrive, some move to a different environment, and some perish in response to natural changes to their environment.

Updated Text: natural changes can affect if an organism survives or perishes. For example, birds might fly away from a forest fire. Droughts can cause organisms to die. However, some animals might walk or fly elsewhere to find food and water to survive.

Component: McGraw Hill Texas Science, Grade 3 Teacher Edition

ISBN: 9781265517908

Current Page Number(s): 333

Location: Back to the Big Idea

Original Text: What are some ways that an animal can survive a sudden change to its environment, such as from a forest fire? Sample answer: A bird could fly to a new location, and a deer or wolf might try to run away from the fire. Gopher tortoises can stay safe in the burrows they dig, and other animals may join them in the burrows.

Updated Text: Could a dinosaur have survived a sudden change to its environment, such as a forest fire? Sample answer: A dinosaur in the past might have flown to a new location like a deer or wolf might try to run away from the fire today.

Component: McGraw Hill Texas Science, Grade 3 Teacher Edition

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address as needed.

Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Heavier objects sink in water.** Explain that objects that are heavy for their size sink while objects that are light for their size float. For example, a small stone is lighter than a large boat, but it sinks while the boat floats.
- **Steam is hot air.** Explain that steam is water vapor, which is water in a gas state. When water vapor condenses in the air, it appears as tiny water droplets. What we commonly refer to as steam is actually wet steam, or a combination of the water vapor and condensed water droplets.

DIFFERENTIATED INSTRUCTION

STRIVING Make Observations To reinforce understanding, model how to set up the activity and demonstrate using each measuring tool. Model making observations by describing aloud what you see each time you measure an object and writing the observations on the Hands-On Activity. Then, guide students by asking What tool would you use to measure this object? Which property of matter

CHALLENGE Have your students to explain this phenomenon. A small stone sinks to the bottom of a lake. A large boat floats on the same lake. Why doesn't the small stone float and the large boat sink? (Gravity pulls a boat on the water down, but the water pushes the boat up. If a boat weighs less than the water it pushes on, then it will float. A stone doesn't take up much space so the force of the water pushing up against the stone is less than the force of gravity pulling it down.)

Current Page Number(s): 38

Location: Overview, Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about force and motion. First, in Experience 1, students investigate pushes, pulls, magnetism, and gravity, and explore how these forces cause objects to move. Then, in Experience 2, they learn how forces affect an object's position and motion.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video of athletes on an obstacle course, and then explore different forces to explain how people use forces to go through the obstacle course. As students progress through the Experiences, they will revisit the Anchoring Phenomenon question, How can a person complete an obstacle course?

Teacher Background

Watch the Teacher Background Video Forces and Motion to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Forces affect objects and can change their position and motion. These forces include pushes, pulls, gravity, and magnetism.
- Contact forces, such as pushes and pulls, affect objects only through direct contact.
- Noncontact forces, such as gravity and magnetism, affect objects without direct contact.
- Stronger forces can have a greater effect on objects than weaker forces.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise, and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- Applying a force always causes an object to move. Explain to students that a force can change the speed or direction of an object, as well as cause the object to stop moving. Reiterate that a force does not always result in motion. Point out that you could exert a force against a wall, but the wall would not move.
- When an object is at rest, there are no forces acting on it. Explain to students that gravity is always pulling objects down toward Earth's center. In addition, an object placed on a surface does not fall to the ground because the

surface is applying a force by pushing up against the object. That is why you can place a book on a desk and it stays there.

Updated Text: Preview the Topic

In this topic, students learn about force and motion. First, in Experience 1, students investigate pushes, pulls, magnetism, and gravity, and explore how these forces cause objects to move. Then, in Experience 2, they learn how forces affect an object's position and motion.

As you progress through the topic, connect the activities back to Matter. Students can apply what they learned in about magnetism as a property of matter (TEKS 3.6A) to what they learn about magnetism as a noncontact force in (TEKS 3.7B).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video of athletes on an obstacle course, and then explore different forces to explain how people use forces to go through the obstacle course. As students progress through the Experiences, they will revisit the Anchoring Phenomenon question, How can a person complete an obstacle course?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Force and Motion by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Teacher Background

Watch the Teacher Background Video Forces and Motion to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Forces affect objects and can change their position and motion. These forces include pushes, pulls, gravity, and magnetism.
- Contact forces, such as pushes and pulls, affect objects only through direct contact.

Original Text: Preview the Topic

In this topic, students learn about matter. In Experience 1, students investigate the properties of matter, including temperature, mass, magnetism, and the ability to sink or float in water. In Experience 2, students describe and classify matter as solids, liquids, or gases. They observe and record how heating or cooling can

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 842 of 3538

change the state of matter. In Experience 3, students learn how materials can be combined to create or modify objects. They use their knowledge of physical properties to justify the selection of materials when combining them.

As you progress through the topic, connect the activities back to what students learned in Grade 2. Students can apply what they learned about classifying matter by physical properties (TEKS 2.6A) to their investigations of matter in Grade 3 (TEKS 3.6A). They can use what they learned about how processes, such as heating and cooling, change matter (TEKS 2.6B) to how they can classify matter as solids, liquids, or gases (TEKS 3.6B). They can use what they learned about materials being made of small units and about what happens when objects touch or collide (TEKS 2.6C, 2.7A) to how materials can be combined and how physical properties are used to justify the selection of materials when combined (TEKS 3.6B).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video showing how ice cream is made with liquid nitrogen. They will observe how liquid cream becomes a solid when it is combined with liquid nitrogen. As students progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How can you make ice cream in an instant?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Matter by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Teacher Background

Watch the Teacher Background Video Matter to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Matter has physical properties that can be measured, including, temperature, mass, magnetism, and the ability to sink or float.
- Matter is classified as a solid, liquid, or gas, and changes in the state of matter can be caused by heating or cooling.
- Combining materials can change their physical properties, and the physical properties of those materials justify their use.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for each Experience. They include a preview of the Experience as well as classroom management strategies to make every Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Heavier objects sink in water.** Explain that objects that are heavy for their size sink while objects that are light for their size float.
- **Steam is hot air.** Explain that steam is water vapor, or water in a gas state. When water vapor condenses in the air, it appears as water droplets.

What we commonly refer to as steam is actually wet steam, or a combination of the water vapor and condensed water droplets.

Updated Text: Preview the Topic

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 845 of 3538

- Applying a force always causes an object to move. Explain to students that a force can change the speed or direction of an object, as well as cause the object to stop moving. Reiterate that a force does not always result in motion. Point out that you could exert a force against a wall, but the wall would not move.
- When an object is at rest, there are no forces acting on it. Explain to students that gravity is always pulling objects down toward Earth’s center. In addition, an object placed on a surface does not fall to the ground because the surface is applying a force by pushing up against the object. That is why you can place a book on a desk and it stays there.

Updated Text: Common Misconceptions

In this topic, students learn that energy is everywhere and can be observed in cycles, patterns, or systems. First, in Experience 1, students identify forms of energy, including light, sound, thermal, and mechanical. They give everyday examples of each type of energy. Then, in Experience 2, students demonstrate how an object’s speed is related to its mechanical energy.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of a roller coaster in motion. This video will help students begin to explore the Anchoring Phenomenon question, How can you build a faster roller coaster?

Teacher Background

Watch the short Teacher Background Video Energy to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Energy is everywhere; it can be found in cycles, patterns, and systems.
- Types of energy include sound, light, thermal, and mechanical energy.
- Thermal energy and light energy relate to temperature changes.
- Mechanical energy is the energy an object has due to movement or position.
- An object moving at a fast speed has more mechanical energy than it does when moving at a slower speed.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise, and address as needed. Common misconceptions are listed in bold type.

The subsequent text explains the misconceptions.

- Energy can be used up or lost. Reinforce to students that energy can change from one form to another, but it cannot be created or destroyed. The total amount of energy available in the universe does not change.
- Only moving objects have mechanical energy. Point out that even objects that are not in motion have mechanical energy, but it is in the form of potential energy rather than kinetic energy.
- Fuel is energy. Explain to students that fuel is a source of energy. For example, fuel such as gasoline must be converted to thermal energy and then mechanical energy in order to power a vehicle.

Updated Text: Preview the Topic

In this topic, students learn that energy is everywhere and can be observed in cycles, patterns, or systems. In Experience 1, students identify forms of energy, including light, sound, thermal, and mechanical. They give everyday examples of each type of energy. In Experience 2, students demonstrate how an object's speed is related to its mechanical energy.

As you progress through the topic, connect the activities back to Topic 2 Force and Motion. Students can apply what they learned about how forces act on objects (TEKS 3.7A) and how motion and position can be changed by pushes and pulls (TEKS 3.7B) to how the speed of an object relates to its mechanical energy (TEKS 3.8B).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of a roller coaster in motion. This video will help students begin to explore the Anchoring Phenomenon question, How can you build a faster roller coaster?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Energy by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Teacher Background

Watch the short Teacher Background Video Energy to refresh your knowledge of

topic content. Key concepts to support instruction of this topic:

- Energy is everywhere; it can be found in cycles, patterns, and systems.
- Types of energy include sound, light, thermal, and mechanical energy.

- An object moving at a fast speed has more mechanical energy than it does when moving at a slower speed.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

Common misconceptions are listed in bold type.

The subsequent text explains the misconceptions.

- Energy can be used up or lost. Energy can change from one form to another, but it cannot be created or destroyed.
- Only moving objects have mechanical energy. Point out that even objects that are not in motion have mechanical energy, but it is in the form of potential energy rather than kinetic energy.
- Fuel is energy. Fuel is a source of energy. A fuel such as gasoline must be converted to thermal energy and then mechanical energy in order to power a vehicle.

Location: Topic 3, Experience 2, Guide Student Planning

Original Text: GUIDE STUDENT PLANNING Have students decide whether to set up one ramp with different starting positions for the car or two identical ramps side by side.

Students will then start the car from different heights and record the time it takes to reach the bottom of the ramp each time. Remind students to make careful observations and track their data accurately. Encourage them to make predictions about the speed of the car before each run.

GUIDE INQUIRY PROCEDURE If students are struggling to design their investigation, suggest these steps to model and support the inquiry process:

1. Set up a cardboard ramp.
2. Mark three different spots on the ramp with tape: high, medium, low.
3. Mark a finish line.
4. Drop the car from the low starting point.
5. Time how many seconds to cross the finish line.
6. Record the time.
7. Repeat steps 4, 5, and 6 from medium and high starting points.
8. Repeat the procedure two more times.

DIFFERENTIATED INSTRUCTION

Data Table To support student comprehension, model how to add data to the table. Record the drop height before sending the car down the ramp. Demonstrate how to use the stopwatch accurately and how to determine and record the number of seconds in the table for each run. Then model how to analyze the data to draw a conclusion about the car's speed.

Challenge To extend the learning for students seeking a challenge, ask them to determine how to record data when variables, such as different ramp angles or surfaces, are introduced

Updated Text: GUIDE STUDENT PLANNING Have students decide whether to set up one ramp with different starting positions for the car or two identical ramps side by side.

Remind students that the goal of the activity is to test how the height of a ramp affects the speed of the model car. If students need additional support, use this scaffolding and guidance for just-in-time learning acceleration. Ask:

- Do you think the car will go faster from a higher or lower starting point on

the ramp?

- What data do you need to collect?
- How can you use these materials to test your prediction?

GUIDE INQUIRY PROCEDURE If students are struggling to design their investigation, suggest these steps to model and support the inquiry process:

1. Set up a cardboard ramp. Mark a finish line at the bottom.
2. Use tape to mark three starting points on the ramp: high medium, low.
3. Drop the car from the low starting point.
4. Record the time it takes to cross the finish line.
5. Repeat steps 3 and 4 from the medium and high starting points.
6. Repeat the procedure two more times.

Location: Topic 5 Overview, Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about patterns on Earth. First, in Experience 1, they will measure and compare weather conditions. Next, in Experience 2, they will describe how soil is formed by weathering and decomposition. Then, in Experience 3, they will explore rapid changes to Earth. Finally, in Experience 4, they will explain how people use resources and the importance of resource conservation.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video about volcanoes in Iceland. They will explore different ways that volcanoes change Earth's surface. As students progress through the Experiences, they will use sensemaking activities to help them answer the Anchoring Phenomenon question, How do volcanoes change the surface of Earth?

Teacher Background

Watch the Teacher Background Video Patterns on Earth to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Weather conditions include factors such as temperature, precipitation, wind, and sun. Different locations experience different weather conditions.
- Slow forces, such as weathering and decomposition, change Earth's surface.
- Rapid forces, such as volcanoes, landslides, and earthquakes, also change Earth's surface.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 860 of 3538

- People use natural resources to make things and in construction, agriculture, and transportation.
- It is important to conserve natural resources through reducing consumption and reusing or recycling resources.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Rocks do not change over time.** Reinforce that weathering by water, wind, and ice gradually change the shape and size of rocks and other landforms by breaking them into smaller pieces.
- **Soil is made of only dirt and does not change over time.** Explain that soil is made up of many different kinds of matter, including the decomposed remains of plants and animals, tiny pieces of rock and shell, and grains of sand. Point out that through the processes of weathering and decomposition layers of soil form on the ground.

Updated Text: Preview the Topic

In this topic, students learn about patterns on Earth. In Experience 1, they will measure and compare weather conditions. In Experience 2, they will describe how soil is formed by weathering and decomposition. In Experience 3, they will explore rapid changes to Earth. In Experience 4, they will explain how people use resources and the importance of resource conservation.

As you progress through the topic, connect the activities back to Topic 4. Students can deepen their understanding of Earth as a planet in relation to the sun, moon, and other planets (TEKS 3.9A, 3.9B) from Topic 4 to what they learn in Topic 5 about patterns on Earth (TEKS 3.10A, 3.10B, 3.10C).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video about volcanoes in Iceland. They will explore different ways that volcanoes change Earth's surface. As students progress through the Experiences, they will use sensemaking activities to help them answer the Anchoring Phenomenon question, How do volcanoes change the surface of Earth?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Patterns on Earth by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Teacher Background

Watch the Teacher Background Video Patterns on Earth to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Weather conditions include factors such as temperature, precipitation, wind, and sun. Different locations experience different weather conditions.
- Slow forces, such as weathering and decomposition, change Earth's surface.
- Rapid forces, such as volcanoes, landslides, and earthquakes, change

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Earth's surface.

- People use natural resources to make things and in construction, agriculture, and transportation.
- It is important to conserve natural resources by reducing, reusing or recycling.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Rocks do not change over time.** Weathering by water, wind, and ice gradually change the shape and size of rocks by breaking them into smaller pieces.
- **Soil is made of only dirt and does not change over time.** Explain that soil is made up of different kinds of matter, including the decomposed remains of plants and animals, tiny pieces of rock, and grains of sand. Through the processes of weathering and decomposition layers of soil form on the ground.

Original Text: LOOK AHEAD

How does this topic connect to what students will learn later?

- 4.10A Describe and illustrate the continuous movement of water above and on the surface of Earth through the water cycle and explain the role of the Sun as a major source of energy in this process.
- 4.10B Model and describe slow changes to Earth's surface caused by weathering, erosion, and deposition from water, wind, and ice.
- 4.11A Identify and explain advantages and disadvantages of using Earth's renewable and nonrenewable natural resources such as wind, water, sunlight, plants, animals, coal, oil, and natural gas.

Also 4.10C, 4.11B

- Vocabulary: climate, conservation, deposition, erosion, fossil fuel, landform, nonrenewable resource, precipitation, recycling, renewable

resource, water cycle, weather,
weathering

Original Text: (New content to address TRR rubric feedback, current content does not exist.)

Updated Text: (New Targeted Instruction Box)

If you have students who have not yet met the grade-level mastery of concepts in this Experience, try these out:
(bullet) Use a thermometer to record the temperature outside. If possible, measure the temperature in a sunny spot and a shady spot to compare. Another option is to measure the temperature in the classroom—try a location close to the window and another location away from the window. Ask How do the temperatures compare? [Sample answer: The temperature is higher in the sun and lower in the shade.]

(bullet) Make a simple rain gauge with a cup and a ruler (alternative is to use a ruler to add markings to a cup). Set the rain gauge outside on a rainy day to see how much rain falls.

Component: *Grade 3 Teacher Guide*

Original Text: GUIDE STUDENT PLANNING Remind students that it is important that they follow the directions closely and to carefully record their observations for each part of the activity so they can draw conclusions at the end. Encourage students to make predictions about what they think will happen to the objects before completing each part. Ask:

- What do you want to learn about forces from this investigation?
- How will you keep track of your observations?
- What predictions have you made?

DIFFERENTIATED INSTRUCTION

Make Observations To support students who are having difficulty setting up the investigation, demonstrate the procedure. Model how to set up the activity, and demonstrate pulling the card away quickly, then slowly. Model making observations by describing aloud what you see each time, and writing the observations on the activity. Alternatively, guide students by asking What did you see? What happened to the objects? and having them write the words they say.

Updated Text: GUIDE STUDENT PLANNING Remind students that it is important that they follow the directions closely and to carefully record their observations for each part of the activity so they can draw conclusions at the end. Encourage students to make predictions about what they think will happen to the objects before completing each part. Original Text: (New content to address TRR rubric feedback, current content does not exist.)

Updated Text: (New Targeted Instruction Box)

If you have students who have not yet met the grade-level mastery of concepts in this Experience, try these out:
(bullet) Tell students that weathering is a very slow process that can take thousands of years, but they are going to model a fast version of weathering. Rub an eraser used for chalkboards against the table to see the shavings. Explain that during weathering the rocks rub against each other, water, etc. and break off into pieces (similar to how the eraser broke into pieces). Safety Remind students not to blow on the chalk dust.

(bullet) Students make a class compost bin. Organic items from lunch such as banana peels, orange rinds, onion peels, coffee grounds, etc. can go into the compost bin to decompose into nutrient-rich organic matter.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Set up the compost bin outside the classroom. Use a large plastic bin with a lid. Drill holes along the bottom and sides of the bin to allow air to move. Place shredded newspaper into the bin. Then add soil, dried leaves, and pine needles. Mix in food scraps. Spray with some water. Put the lid on. Every few days, mix or roll the contents. Use the decomposed material in a garden as fertilizer. Safety Remind students to wear gloves and wash their hands. Do not include meat, fish, bones, fats, or oils in the compost bin.

Updated Text: (New Targeted Instruction Box)

If you have students who have not yet met the grade-level mastery of concepts in this Experience, try these out:

- (bullet) Use baking soda and vinegar to model a volcanic eruption. Note how the liquid moves down the sides of the container to model how lava moves down a volcano. Explain to students that real volcanoes erupt because of changes deep inside Earth. Discuss whether the model is accurate. Explain that models are helpful but have limitations. Discuss the limitations of this volcano model, such as its size, materials, and effects of the eruption.

- (bullet) Use books and a piece cardboard to build a small ramp. Try sliding rocks or pebbles down the ramp. Then change the slope of the ramp. Ask How does the slope affect the speed of the landslide? [Sample answer: When the slope is

steeper, the pebbles moved downhill faster. The greater the slope, the faster the movement.]

Location: Topic 5, Experience 4, Guide Student Planning

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 871 of 3538

Original Text: GUIDE STUDENT PLANNING Explain to students that they should choose one specific piece of garbage for their plan, and guide them to think about how it could be reduced. Encourage students to focus on reducing, reusing, and recycling. Ask:

- What reusable item could replace the piece of garbage?
- What else can you make from the piece of garbage?
- How could people at your school use less of this item?

GUIDED INQUIRY PROCEDURE If students struggle to make a plan, suggest these guided inquiry steps to model and support the inquiry process:

1. Choose a specific type of garbage to focus on (such as paper lunch bags or plastic water bottles), and decide if you will reduce, reuse, or recycle it.
2. Brainstorm ways that the trash can be reduced (use a reusable bag for your sandwich instead of a plastic baggie), reused (a tissue box can be reused to hold classroom supplies), or recycled (extra paper or worksheets can go in a recycling bin and be used for scratch paper during math lessons).
3. If you're stuck, focus on reducing trash. For example, don't use plastic drinking straws.

Updated Text: GUIDE STUDENT PLANNING Explain to students that they should choose one specific piece of garbage for their plan, and guide them to think about how it could be reduced. ISBN: 9781323223345

Current Page Number(s): 150

Location: Topic 6 Overview, Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about ecosystems as they explore the patterns, cycles, systems, and relationships within environments. First, in Experience 1, students explain how temperature and precipitation affect animal growth and behavior and plant responses. Next, in Experience 2, students describe the flow of energy in a food chain and predict how changes in a food chain affect the ecosystem. Then, in Experience 3, students describe how natural changes to the environment cause organisms to thrive, perish, or change location. Finally, in Experience 4, students identify fossils as evidence of past living organisms and their environments.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video of the migration of monarch butterflies and then explore why butterflies migrate.

As students progress through the Experiences, they will answer the Anchoring Phenomenon question Why do monarch butterflies come here?

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 873 of 3538

Teacher Background

Watch the Teacher Background Video Interactions with Ecosystems to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Temperature and precipitation affect animal growth and behaviors through migration and hibernation and plant responses through dormancy.
- A food chain shows the feeding relationships between organisms in an ecosystem, and changes to a food chain can affect the entire ecosystem.
- Natural environmental changes, such as droughts or floods, can cause organisms to thrive, perish, or move to a new location.
- Fossils are the preserved remains of extinct organisms. There are two main categories of fossils: body fossils and trace fossils.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise, and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Hibernation is the same as being asleep.** Explain that a hibernating animal's breathing and heart rate are much slower than when the animal is asleep. In addition, a hibernating animal's brain activity is different from when it sleeps.
- **Organisms at the top of a food chain have the most energy.** Explain that organisms use most of their energy in their daily activities. Only a small amount of energy is transferred to the next level in the food chain.
- **Fossils are found everywhere.** Explain that fossils are rare and tend to be found in sedimentary rock that has been exposed due to weathering and erosion.

Updated Text: Preview the Topic

In this topic, students learn about ecosystems as they explore the patterns, cycles, systems, and relationships within environments. In Experience 1, students explain how temperature and precipitation affect animal growth and behavior and plant responses. In Experience 2, students describe the flow of energy in a food chain and predict how changes in a food chain affect the ecosystem. In Experience 3, students describe how natural changes to the environment cause organisms to thrive, perish, or change location. In Experience 4, students identify fossils as evidence of past living organisms and their environments.

As your progress through the topic, connect the activities back to Topic 5, Patterns on Earth. Students can use what they learned about weather, including temperature and precipitation, (TEKS 3.10A) and apply it to what they are learning about how temperature and precipitation affect animal growth and behavior and plant responses in Topic 6 (TEKS 3.12A). They can use what they learned about slow and rapid changes on Earth's surface (TEKS 3.10B, 3.10C) to how natural changes to environments affect organisms and to how fossils formed (TEKS 3.11C, 3.11B).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video of the migration of monarch butterflies and then explore why butterflies migrate.

As students progress through the Experiences, they will answer the Anchoring Phenomenon question Why do monarch butterflies come here?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Interactions in Ecosystems by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on

Realize.

Teacher Background

Watch the Teacher Background Video Interactions with Ecosystems to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Temperature and precipitation affect animal growth and behaviors through migration and hibernation and plant responses through dormancy.
- A food chain shows the feeding relationships between organisms in an ecosystem, and changes to a food chain can affect the entire ecosystem.
- Natural environmental changes, such as droughts or floods, can cause organisms to thrive, perish, or move to a new location.
- Fossils are the preserved remains of extinct organisms. There are two main categories of fossils: body fossils and trace fossils.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Hibernation is the same as being asleep.** Explain that a hibernating animal's breathing and heart rate are much slower than when the animal is asleep. In addition, a hibernating animal's brain activity is different from when it sleeps.
- **Fossils are found everywhere.** Explain that fossils are rare and tend to be found in sedimentary rock that has been exposed due to weathering and erosion.

responses through dormancy.

Updated Text: Objectives

Students will explain how temperature and precipitation affect animal growth and behavior through migration and hibernation and plant responses through dormancy.

Students identify patterns in bird migration to explain why birds migrate.

Component: *Grade 3 Teacher Guide*

ISBN: 9781323223345

Current Page Number(s): 159

Location: Topic 6, Experience 1, Before the Stations; Address Prior Knowledge

Original Text: Review the exit tickets collected from the Engage activity. Identify prior knowledge about ecosystems.

Updated Text: Review the exit tickets collected from the Engage activity. If the exit tickets reveal gaps in understanding or misconceptions, use this scaffolding and guidance for just-in-time learning acceleration.

Component: *Grade 3 Teacher Guide*

ISBN: 9781323223345

Current Page Number(s): 160

Location: Topic 6, Experience 1, Guide Student Planning

Original Text: GUIDE STUDENT PLANNING Have students decide which color they will use for each bird/location before starting the activity, and ask them to avoid using similar colors. Explain that using distinct colors will help the migration pattern of each bird stand out visually, and make the map easier to understand.

DIFFERENTIATED INSTRUCTION

Reading a Data Table To reinforce understanding, model how to read the data table, use the information to label locations, and plot the migration pattern on the map. Consider writing simplified steps with pictures for students to follow, and/or providing students with a partially prefilled Hands-On Activity. For example, if the locations and migration pattern are filled in for one bird, students can use it as a guide to complete the information for the second bird. Challenge For students who are ready for a challenge, have them research a third bird and map its migration, and then compare its behavior to the other two birds' behaviors.

Updated Text: GUIDE STUDENT PLANNING Have students decide which color they will use for each bird/location before starting the activity, and ask them to avoid using similar colors. Explain that using distinct colors will help the migration pattern of each bird stand out visually, and make the map easier to understand. If students need additional support, use this scaffolding and guidance for just-in-time learning acceleration. Ask: ^[11]_[SEP]What does the temperature data show? What can you infer from this data and the bird's migration patterns?

DIFFERENTIATED INSTRUCTION

SPECIAL NEEDS Students who have language impairments may benefit from having simplified steps with pictures to follow, and/or a partially prefilled Hands-On Activity. For example, if the locations and migration pattern are filled in for one bird, students can use it as a guide to complete the information for the second bird.

CHALLENGE For students who are interested, have them research a third bird and map its migration, and then compare its behavior to the other two birds' behaviors.

Updated Text: (New Targeted Instruction Box)

If you have students who have not yet met the grade-level mastery of concepts in this Experience, try these out:

(bullet) Ask students how they think an animal would prepare for hibernation. Facilitate a discussion about making sure the animal has eaten enough food and that it has a safe, warm space to hibernate. Students can make a “to do” list of what the animal should do to prepare for hibernation.

(bullet) Have students draw two pictures of a plant. One drawing should show the plant in its dormant state and the other should show the plant in bloom. Ask How do the two images differ? [Sample answer: The dormant plant is brown and dry. The blooming plant has colorful flowers.] Ask What caused the plant to go dormant? [Sample answer: Temperature and/or rain made the plants go dormant.]

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 878 of 3538

a real food chain. In addition, emphasize the importance of researching each organism to label it accurately. Have students work in small groups to design a card game that results in a five-part food chain. Encourage students to be specific when they decide how to play the game. Ask What is the goal of the game? How does it start? How does it end? How is a winner determined?

DIFFERENTIATED INSTRUCTION

Researching Organisms To support understanding, guide students to select an ecosystem on which to base their cards. Then model how to research an organism to find out if it is a producer or consumer. Choose one organism and walk students through answering the research question in Step C. Start with these questions: Is the organism a plant? Does it eat? Then have students work with a partner to research the organisms and label the backs of their cards with each category.

Challenge For students who are ready for a challenge, have them build as many food chains as possible or the longest food chain possible. Students can be challenged to invent their own food chain card games for a different ecosystem.

ISBN: 9781323223345

Current Page Number(s): 190

Location: Topic 7 Overview, Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about organisms. First, in Experience 1, they explore and explain how external structures and functions of animals enable them to survive in their environment. Then, in Experience 2, they explore, illustrate, and compare the life cycles of various organisms.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of woodpeckers using different structures, such as their beaks, wings, and claws, to help them survive in their environments. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, How do the structures of the pileated woodpecker help it survive in the forests of Texas?

Teacher Background

Watch the Teacher Background Video Organisms to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- External structures and functions of animals, such as a giraffe's long neck or a duck's webbed feet, enable them to survive in their environment.
- Organisms undergo similar life processes, and life cycles are a series of stages organisms go through during their life.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience, as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- In a butterfly's life cycle, the larva spins a cocoon. Explain that the larva of a butterfly becomes a pupa, and the adult butterfly emerges after the pupa splits open.
- The purpose of soil is only to hold plants in place. Point out that soil is made up of many different kinds of matter, including nutrients that plants need to

Proclamation 2024: Report of Editorial Changes (11/08/2023)

grow and survive. In addition, a plant's roots absorb water from soil.

- In order to be considered alive, an organism must move and have external features for eating and breathing, as most animals do. Reinforce to students that plants are living organisms that breathe, reproduce, and make their own food. In addition, some animals do not move.

Updated Text: Preview the Topic

In this topic, students learn about organisms. In Experience 1, they explore and explain how external structures and functions of animals enable them to survive in their environment. In Experience 2, they explore, illustrate, and compare the life cycles of various organisms.

As you progress through the topic, connect the activities back to Topic 6, Interactions in Ecosystems. Students can apply what they learned about how temperature and precipitation can affect animal migration and behavior and plant responses (TEKS 3.12A) to what they learn about life cycles in Topic 7. They can also start to connect what they are learning in Topic 7 about external structures and functions to what they learned in Topic 6 about food chains (TEKS 3.12B) and why organisms are more likely thrive or perish when natural changes occur to an environment (TEKS 3.12C).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of woodpeckers using different structures to help them survive in their environments. As students progress through the topic, they will answer the Anchoring Phenomenon question, How do the structures of the pileated woodpecker help it survive in the forests of Texas?

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Organisms by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Teacher Background

Watch the Teacher Background Video Organisms to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

Current Page Number(s): 191

Location: Topic 7, Topic Overview, Home Connections

Original Text: (Adding Home Connections Box This was previously not included.)

Updated Text: (NEW HOME CONNECTIONS BOX)

Share the Topic School-to-Home letter with parents and caregivers to provide information that supports student learning.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 887 of 3538

Use the Home Communication Guide for additional ideas to bring home learning into the classroom.

Component: *Grade 3 Teacher Guide*

ISBN: 9781323223345

Current Page Number(s): 196

Location: Topic 7, Experience 1, At-A-Glance; Objectives

Original Text: Objectives

Students will describe external structures and functions of animals and explore and explain how these structures and functions enable animals to survive in their environment.

Updated Text: Objectives

Students will describe external structures and functions of animals and explore and explain how these structures and functions enable animals to survive in their environment.

Students will design a mechanical hand that can hold objects.

Component: *Grade 3 Teacher Guide*

ISBN: 9781323223345

Current Page Number(s): 199

Location: Topic 7, Experience 1, Before the Stations; Address Prior Knowledge

Original Text: Review the exit tickets collected from the Engage activity. Identify prior knowledge about structures and functions.

Updated Text: Review the exit tickets collected from the Engage activity. If the exit tickets reveal gaps in understanding or misconceptions, use this scaffolding and guidance for just-in-time learning acceleration.

Component: *Grade 3 Teacher Guide*

ISBN: 9781323223345

Current Page Number(s): 200

Location: Topic 7, Experience 1, Guide Student Planning

Original Text: GUIDE STUDENT PLANNING Encourage students to study their own hands as they pick up and hold objects as models for their designs. Emphasize the fact that a hand works by opening and closing, and that fingers are able to bend, which enables them to close around and hold objects. Guide students to think about which materials they can use to open and close the fingers of their mechanical hand. Ask:

- What is the goal of this activity?
- What does your design need to achieve that goal?
- How does observing your own hand help you design a mechanical hand?

Updated Text: GUIDE STUDENT PLANNING Encourage students to study their own hands as they pick up and hold objects as models for their designs. Location: Topic 7, Experience 1, Evaluate, Quiz, 1st Paragraph

Original Text: STRUCTURES AND FUNCTIONS

Students answer questions about structures and functions by completing an editable/printable or online quiz. Give students mastering English language extra time to translate assessments as needed.

Updated Text: STRUCTURES AND FUNCTIONS

Students answer questions about structures and functions by completing an editable/printable or online quiz. Give students mastering English language extra time to translate assessments as needed.

If the quiz reveals students have not yet achieved grade-level mastery of the content in this Experience, remember that you can assign assets and activities that support the TEKS on the course to provide intervention. Look especially for "got-more-time" assets, those marked with a plus sign which are designed to personalize learning, such as Topic Readers. You can also use the activities in "Targeted Instruction" to close any learning gaps identified.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 889 of 3538

Updated Text: (New Targeted Instruction Box)

If you have students who have not yet met the grade-level mastery of concepts in this Experience, try these out:

(bullet) Have students work in pairs. Gently tape their thumbs to their palms. Then have students try to complete simple tasks such as writing with a pencil, tying a shoelace, turning pages of a book, etc. Then discuss the function of our thumb and the structure of our hands. This can also connect to the STEAM Station. Safety Make sure students do not force their thumbs into a painful position.

(bullet) Provide a medium-sized container of water. Have students spread their fingers and slide them through the water. Then have students keep their fingers close together and slide through the water again. Students should see that when the fingers are closer together, the hand can move more water than when the fingers are separated. This is similar to how webbed feet help ducks and other animals easily glide through water. Safety Wipe up any spills immediately.

Updated Text: (New Targeted Instruction Box)

If you have students who have not yet met the grade-level mastery of concepts in this Experience, try these out:
(bullet) Show students examples of seeds from cut up fruit. Good seeds to use include apple seeds, orange seeds, cucumber seeds—any seeds from common fruits and vegetables. Show students that the seed is often inside the fruit. Have students examine and compare these different seeds from the fruits. Ask How does that seed grow into a new plant? [Sample answer: The seed contains the young plant. Water, soil, and sunlight help the young plant grown into a seedling and then an adult plant.]

(bullet) Have students choose a life cycle they learned about in the experience. Then, have students use craft and classroom materials to build a 3-D model of the life cycle. Finally, have students present and explain their model to a partner or the class.

Original Text: Weather happens as a result of things happening in the atmosphere. Temperature, precipitation, wind, cloud coverage, and air pressure all affect our weather. If a storm is coming in, there will be precipitation, or water falling from the clouds. The temperature helps determine what form of precipitation will come down from the clouds. It could be snow, rain, sleet, or freezing rain. Water freezes at 32 degrees Fahrenheit (32° F).

Snow is the tiny particles of ice. It falls from the clouds when the water vapor in the clouds freezes. It stays frozen until it reaches the ground.

Rain is the condensed water vapor that falls from the clouds. It is warmer than freezing for most of its fall from the clouds.

Sleet starts as snow. It goes through a layer of warm air, then back to a layer of cold air. The snow melts to water and then freezes again. The result is tiny pieces of ice on the ground.

Freezing rain happens when the snow falls to the ground and, before hitting the ground, melts into rain. Then, the water freezes again when it touches the ground.

Updated Text: Weather happens as a result of events in the atmosphere. Temperature, precipitation, and wind all affect the weather. So do cloud coverage and air pressure. If a storm is coming in, there might be precipitation. Precipitation is

cause: something that brings about a result

change: to make or become different

effect: a result that is produced by a cause

Proclamation 2024: Report of Editorial Changes (11/08/2023)

energy: the ability to do work or create change
function: the purpose of something or how it works
matter: anything that has weight or takes up space
model: a small but exact copy of something
pattern: repeated information that can be used to predict future information
proportion: the size or amount of one thing or group as compared to the size or amount of another
quantity: the amount of something
scale: the size of a model of a thing compared to the size of the thing itself
stability: the condition of being stable, or unchanging
structure: the way something is made or the parts of a living thing
system: a set of things working together

Unit 1 Week 3

investigation: studying something to find an answer to a question
model: a visual or 3D representation, typically on a smaller scale than the original
phenomenon: an observable event
scientific and engineering practices: the skills scientists and engineers use in an investigation

Unit 1 Week 4

constraint: a limitation or boundary that engineers face when designing solutions to problems (materials, time, or cost)
criteria: standards by which engineers know that a solution is successful
engineering design process: series of common steps used to create a functional item that improves science or society
engineering problem: a challenge meant to be solved by creating a physical solution that will improve the daily lives of people or society
ideate: the process of forming ideas
prototype: the first version or draft of an engineering design

Updated Text: (Added Asterisks and vocabulary disclaimer)

Unit 1 Week 1

collaboration*: the ability to work together as a group
engineer*: someone who applies their scientific knowledge to create and build products that solve problems
engineering*: the process of using science in practical applications
mindset*: a personal attitude toward something
science*: the search for knowledge, applying knowledge, and understanding the world through evidence gained from investigation
scientist*: someone who studies science
tool*: a device used to solve a problem

*Vocabulary may have been previously taught in prior grades.

Unit 1 Week 2

cause*: something that brings about a result
change: to make or become different
effect*: a result that is produced by a cause
energy*: the ability to do work or create change
function*: the purpose of something or how it works
matter*: anything that has weight or takes up space
model*: a small but exact copy of something
pattern*: repeated information that can be used to predict future information
proportion*: the size or amount of one thing or group as compared to the size or amount of another
quantity*: the amount of something
scale*: the size of a model of a thing compared to the size of the thing itself
stability*: the condition of being stable, or unchanging
structure*: the way something is made or the parts of a living thing
system*: a set of things working together

*Vocabulary may have been previously taught in prior grades.

Unit 1 Week 3

investigation*: studying something to find an answer to a question

model*: a visual or 3D representation, typically on a smaller scale than the original

phenomenon*: an observable event

scientific and engineering practices: the skills scientists and engineers use in an investigation

*Vocabulary may have been previously taught in prior grades.

Unit 1 Week 4

constraint*: a limitation or boundary that engineers face when designing solutions to problems (materials, time, or cost)

Investigating Mass

Mass is ____

You can measure mass with balances and weight with scales. Place an object on a scale to find the weight in grams. To use a balance, place an object on one side. On the other side, place weights until the balance reads zero. Add up the weights to find the mass of the object.

Directions: Remember the objects you found at Boca Chica Beach? Use a digital scale to find their weight.

Have you ever mailed a package? It costs money to mail things. Before you pay for your package to be sent, a post office clerk weighs the package on a digital scale. The scale tells them how much the package weighs. The more it weighs, the more the package costs to send. Aleki wants to send a package to his cousin in Galveston. Aleki lives in Dallas. To mail a package that is 5 grams that far would cost \$5.00. Aleki has \$12.00. He wants to send his cousin candies. Use the chart to decide which candies he should put in the package.

Updated Text: (Activity 3)

Investigating Mass:

Mass is ____

You can measure mass with a balance or digital scale. Place an object on a scale to find the mass in grams. To use a balance, place an object on one side. On the other side, place weights until the balance reads zero. Add up the weights to find the mass of the object. Both tools give us mass.

Directions: Remember the objects you found at Boca Chica Beach? Use a digital scale to find their mass.

Have you ever mailed a package? It costs money to mail things. Before you pay for your package to be sent, a post office clerk weighs the package on a digital scale. The scale tells them how much the package weighs. The more it weighs, the

Investigating with Magnets

Magnets are a metal that attract or repel other magnetic objects. Magnets have a north pole and a south pole. When you place two like poles together, they repel one another. You can feel the force of them pushing away from each other. When you place a north and a south pole together, they are pulled together. The size and strength of the force depends on two things. First, the size of the magnet will affect the strength of the force. A huge magnet will have a stronger force than a tiny magnet. Second, distance will affect the strength of the force. A magnet far from an object it could be attracted to will likely not have much effect. Magnets are used all around us.

Updated Text: (Activity 4)

Magnets are a metal that attract or repel other magnetic objects. Magnets have a north pole and a south pole. When you place two like poles together, they repel one another. You can feel the force of them pushing away from each other. When you place a north and a south pole together, they are pulled together. The size and strength of the force depends on two things. First, the size of the magnet will affect the strength of the force. Second, distance will affect the strength of the force. You can measure magnetism by testing whether or not a material is attracted to a magnet. You can also measure how close an object has to be to a magnet when it moves towards the magnet.

Updated Text: Reflect and Connect

Explain what precipitation is and describe the similarities and differences you see between the precipitation in the phenomenon. What could this say about the distance between the cities?

Precipitation is any form of water that falls from the sky. In the phenomenon, Gina and Claire are not experiencing any precipitation, and Miguel is experiencing snow. This tells me the cities are far from each other.
