2. Is the change in density similar to the changes in heat and pressure? Explain. (Yes. Temperature, pressure, and density all increase the farther down you go, or the closer you get to the inner core.)

Updated Text: Alternative Exit Ticket Ask students to put their thumbs up if the answer is increasing or put their thumbs down if the answer is decreasing.

When going from the crust to the mantle, to the outer core, and then the inner core temperature _____. (thumbs up for increases)

When going from the innermost layer of Earth to the outermost layer of Earth, pressure _____. (thumbs down for decreases)

Original Text: Objective
Students will learn explore how metamorphic, igneous, and

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1812 of 3538

sedimentary rock form and change through the rock cycle.

Updated Text: Objectives

- Students will model the rock cycle to collect, analyze, and interpret data, to explain the differences between metamorphic, igneous, and sedimentary rocks and how they form.
- Students will explore the cause-and-effect relationships within Earth's materials to describe the flow of energy and matter within the rock cycle.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 190

Location: Everyday Phenomenon Activity

Original Text: They use prior knowledge, personal experiences, and observations from the Anchoring Phenomenon video as preliminary evidence. Remind students that when they first answer the questions, they are not expected to know the correct answer. They will revise their written explanation or model throughout the Topic as they gather new information and evidence.

Updated Text: They use prior knowledge, personal experiences, and observations from the Everyday Phenomenon video as preliminary evidence. Remind students that when they first answer the questions, they are not expected to know the correct answer. They will revise their written explanation or model at the end of Explain.

Updated Text: Idea Boxes

Idea boxes placed throughout the chapter text function to provide opportunities for collaborative discussion of content, review of content introduced, and focus on certain content that is harder to grasp. Guidance on how to use the idea boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by:

- Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support).
- Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box.
- Planning to have at hand any materials needed to implement the Idea box.
- Reviewing the task information contained within the Idea boxes.

Updated Text: Teachers are encouraged to include caregivers in as much of the education process as possible. Hold regular meetings and encourage individuals to partake; ensure they know their opinions and voices are valued. For caregivers that may not be able to attend meetings, use another form of communication so their voices are also included. Acknowledge and show gratitude for the time caregivers give to help the students. When schools, and teachers, communicate well with caregivers, everyone involved benefits!

Original Text: Launch the interactive and complete the following:

1. Read the introduction and then click the Continue button.
2. Move your cursor over each numbered arrow to read the description.
3. Drag the numbered arrow into the diagram in the correct order.
4. Describe the steps for air convection in the correct order in Table 1.
5. If needed, press the reset button to view the descriptions again.
6. In Table 2, describe the kinetic energy, density, and movement of warm and cold air.

Updated Text: Launch the interactive and complete the following:

Activity 1:

1. Select the number of ice cubes to cool the bowl of soup.
2. Observe the final temperature of the soup and the time taken.
3. Note your observations in your notebook.
4. Repeat with all four options from zero to three ice cubes.

Activity 2:

1. Read about air movement when a space is heated or cooled down.
2. Identify the air movements represented by the arrows. (Hint: red represents warm air, blue represents cool air)
3. Select the tiles to show how the warm and cool air move due to a heater.

Location: Interact

Original Text: Launch the interactive and complete the following steps:

1. Select a boundary type and crust types.
2. Start the simulation and observe how the plates interact.
3. Summarize in the data table what happens to the plates and what surface features occur.
4. Record the names of all locations in the examples given.
5. Repeat the steps to record data for each plate interaction.

Updated Text: Launch the interactive and complete the following steps:

1. Read about landforms at plate boundaries.
2. Select a location on the map.
3. Identify the type of boundary at the location on the map.
4. For each location, determine the type of crust and the type of plate boundary.
5. Read about the type of boundary at each location, being sure to record the names of all locations in the examples given.
6. Repeat the steps to record data for each location on the map.
7. Summarize in the data table how surface features form at each plate boundary and the names for all the example locations.

Original Text: Planetary Patterns

Record the patterns you observe in each property among the planets.

Speed: Speed decreases with distance from the sun.

Revolution: The period of revolution, or length of a year, increases with distance from the sun.

Rotation: The planets closest to the sun have the longest days, and the distant planets have short days.

Temperature: The temperature generally decreases with distance from the sun, although Venus has an unusually high temperature.

Mass: The four inner planets are much less massive than the four outer planets.

Updated Text: Planetary Patterns

Record the patterns you observe in each property among the planets.

Surface: Outer planets have a gaseous surface. Inner planets have a rocky surface.

Satellite: Outer planets have many satellites. Inner planets have few or no satellites.

Rings: Outer planets have rings. Inner planets have no rings.

Size: Outer planets are large. Inner planets are relatively large.

Original Text: Discuss the following with a classmate:

What did the different pieces in our model represent? The chocolate squares represented oceanic crust, the crackers represented continental crust, and the marshmallow cream represented melted or partially melted rock from beneath the crust.

What causes one plate to subduct or sink under the other? One plate subducts under another when the plates collide at convergent boundaries. Generally, the denser plate subducts beneath the less-dense plate.

How do divergent boundaries cause an ocean to widen? New rock is generated at a mid-ocean ridge, which is formed at a divergent

Page 1849 of 3538

boundary. The rock spreads outward from the ridge—an event called seafloor spreading. How do convergent boundaries cause volcanoes and mountain building? When an ocean plate subducts as it collides with a continental plate or another ocean plate, the subducting plate melts and forms magma. The magma rises toward the surface and forms a volcano. Mountains form when a continental plate crumples during collision.

ISBN: 9781616292522

Current Page Number(s): 87

Location: Analyze > Discussion

Original Text: Discuss the following with a classmate:

What did the different pieces in our model represent?

What causes one plate to subduct or sink under the other?

How do divergent boundaries cause an ocean to widen?

How do convergent boundaries cause volcanoes and mountain building?

Updated Text: Discuss the following with a classmate:

What did the different pieces in our model represent?

What causes one plate to subduct or sink under the other?

How do divergent boundaries cause an ocean to widen?

How do convergent boundaries cause volcanoes and mountain building?

Which plate boundary most likely forms ocean basins?

Original Text: You know that a pizza coming out of the oven can be very hot. But did you know that there are different materials that can be used to cook a pizza? Heat moves through different materials at different rates. If we place one end of a material in a beaker of heated liquid and the other end in a beaker of room temperature liquid, we can observe if heat moves through the material by conduction and, if so, measure how quickly the heat transfers.

Updated Text: Heat moves through different materials at different rates. Engineers must use the correct materials for the specific purpose. If a water park wants to build a bridge between the hot tub and cold pool, they do not want too much heat to escape. What material should they use to connect the tub and the pool?

Original Text: Asexual reproduction is reproduction in which offspring are produced by a single parent. Asexual reproduction primarily occurs through mitosis or cell division. In mitosis, a cell duplicates its DNA and splits into two identical cells. When an organism reproduces asexually, the offspring are genetically identical to, or clones of, the parent. This method of reproduction usually occurs in a very short time.

Mitosis is the same process that living things use to create new cells as they grow or heal. When we get a cut on our skin, the cells divide to create new cells as our skin heals. All multicellular organisms, like plants and animals, depend on mitosis for growth and repair. However, not all living things can use mitosis to reproduce asexually.

Updated Text: Asexual reproduction is when offspring are produced by a single parent. The offspring are genetically identical clones of the parent. Many single-celled organisms reproduce asexually through cell division. In this process, a cell duplicates its genetic material and splits into two identical cells. This process usually takes less than a day.

Many multicellular organisms, like plants and animals, use cell division for growth and repair. Cell division in eukaryotes is called mitosis. Mitosis creates new cells for these organisms to grow or heal. To heal a cut on our skin, cells divide to create new cells to replace damaged ones. Prokaryotes, like bacteria, use cell division to reproduce asexually. In prokaryotes, cell division is called binary fission.

Original Text: Genetic information, or DNA, is stored in the chromosomes of cells of all organisms. Organisms that reproduce sexually have chromosomes that come in matching pairs, one from each parent. The process of meiosis shuffles and recombines the genes on each pair of chromosomes. Each parent always passes down half of their recombined chromosomes to their offspring during sexual reproduction. Recombined chromosomes are passed down in specialized cells called gametes. Sperm cells and egg cells are examples of gametes. Gametes come together through fertilization. Offspring from sexual reproduction will have a mixture of genetic material from each parent and develop a blend of traits from both. Meiosis explains why children always have traits that vary from their parents.

Updated Text: Genetic information (DNA) is stored in the chromosomes of cells. Organisms that reproduce sexually have chromosomes that come in matching pairs, one from each parent. The process of meiosis shuffles and recombines the genes on each pair of chromosomes before they are passed down. Original Text: Planetary Patterns

Record the patterns you observe in each property among the planets.

Speed: Speed decreases with distance from the sun.

Revolution: The period of revolution, or length of a year, increases with distance from the sun.

Rotation: The planets closest to the sun have the longest days, and the distant planets have short days.

Temperature: The temperature generally decreases with distance from the sun, although Venus has an unusually high temperature.

Mass: The four inner planets are much less massive than the four outer planets.

Updated Text: Planetary Patterns

Record the patterns you observe in each property among the planets.

Surface: Outer planets have a gaseous surface. Inner planets have a rocky surface.

Satellite: Outer planets have many satellites. Inner planets have few or no satellites.

Rings: Outer planets have rings. Inner planets have no rings.

Size: Outer planets are large. Inner planets are relatively large.

Updated Text: In this investigation, you will use quantitative measurements to determine the relationship between the temperature (in deg C) and the rate of dissolving (sec). You will use qualitative measurements to determine when the Alka-Seltzer is completely dissolved. Quantitative data is information that can be measured and expressed in numbers. Qualitative data is information that describes qualities or characteristics and is usually expressed in words.

Updated Text: Speed is a measure of how fast an object moves or how quickly something changes position over a specific period of time. In simpler terms, it tells us how fast or slow something is going. Speed is typically measured in units like meters per second (m/s) or kilometers per hour (km/h). The higher the speed value, the faster the object is moving. Conversely, a lower speed value indicates slower motion. To calculate speed, you use the formula:

Speed = Distance ÷ Time

Location: In Grade 7, Unit 3, Lesson 6 Section 2 (Asexual Reproduction)

Original Text: Once all students have created a model, sketched it in their notebooks, and have written their observations, have a class discussion of what they observed. Guide students to summarize the following: In asexual reproduction, there is a single parent and the offspring are identical to each other and to the parent. The offspring have exactly the same traits as the parent because the offspring have the same genetic material as the parent. Students should write their summaries below their sketches in their science notebooks as directed on the instruction sheet.

Updated Text: Once all students have created a model, sketched it in their notebooks, and have written their observations, have a class discussion of what they observed. Guide students to summarize the following: In asexual reproduction of plants and animals, there is a single parent and the offspring are identical to each other and to the parent. The plant and animal offspring have no genetic diversity because they have the same genetic material as the

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1875 of 3538

parent. With asexual reproduction, the genetic diversity of a population of plants or animals will not change over generations.

Original Text: The Grade 7 integrated science curriculum is designed around the TEKS and ELPS and has the goal of helping make science and engineering relevant and engaging for students. We take to heart the notion that giving students opportunities to work on real-world problems can promote science learning and student engagement and a full description of the research behind the curriculum and the instruction design is provided at <https://www.greenninja.org/texas/>. The core of the curriculum is helping to make science fun and interesting for students. Student motivation is a critical component of learning, so our goal is to help teachers make their classes as engaging for students as possible. We recognize that beginning to teach a new curriculum is not always a smooth process, so we've tried to make this shift to new territory as easy as possible. If you have any questions or comments, urgent or non-urgent, or anywhere in between, please send us a message (e.g., via the Contact Us button on each webpage or email at contact@greenninja.org).

Grade Storyline

The theme for the integrated Grade 7 curriculum is Sustaining Life. A brief outline of the year-long sequence of units and the associated culminating experiences is provided below.

The year begins with Unit 1, Food, which focuses on the energy and materials that plants need for their growth. Students explore photosynthesis, solutions, and chemical reactions. They use the periodic table to help to makes sense of all the elements, and they study the ecosystem and its cycles of energy, followed by the relationship between humans and the oceans. Students will learn to analyze what they eat and to understand where food comes from through the food life cycle. The culminating project gives students the opportunity to design menus containing food items that are both nutritious and have a minimal effect on the environment.

Unit 2, Water, has a unit-wide focus on planning for a flood event. With global temperature increasing, the likelihood of severe flooding has risen. Students explore the science of storm surges, with an emphasis on how they contribute to flooding in coastal areas. Role-playing as part of a press conference helps students to identify key infrastructure issues that would need to be considered in an extreme weather event. They also consider different ways to adapt to floods or to mitigate their effects. They also learn that access to fresh water and food after a flood must be considered. To conclude the unit, students participate in a multi-day disaster emergency simulation in which they take on the roles of different members of the community and design solutions to flooding events.

Unit 3, Humans and Life, is a study of how genetic diversity helps different populations survive. Students compare artificial and natural selection and the importance of traits to surviving in one's environment. The human body is a complex system of sub-systems, each with different and important roles; students conduct research into these sub-systems and their roles. The culminating experience, creating a documentary, highlights the importance of genetic variation in the survival of a species.

Unit 4, Exploring Early Earth is the final unit for the year and gives students an idea of Earth's place in space. Studying past asteroid impacts shows how Earth has changed over time and students see how, as a result, the organisms inhabiting the Earth have also changed. Rock layers and fossils give clues about the history of the Earth. The theory of

Proclamation 2024: Report of Editorial Changes (11/08/2023)

continental drift suggests how tectonic plates are constantly on the move. Students also learn how Newton's Laws of Motion can be used to prevent another asteroid collision in the future. The culminating project is a creative way for students to plan for the possibility of a future asteroid collision.

Updated Text: We are excited to welcome you to our Grade 7 curriculum for Texas! Green Ninja's approach learning uses a storyline model where each unit begins with a locally relevant, real-world challenge and culminates in a project in which students showcase how they meet the challenge using the science they've learned in the unit. This is what drives student learning.

As students proceed through the lessons, they'll use various scientific and engineering practices (SEPs) and recurring themes and concepts (RTCs) to help students build a cohesive understanding of science and the core ideas. Additionally, our curriculum meets all English Language Proficiency Standards (ELPS) to ensure that all learners have the opportunity to succeed.

We want to make your teaching experience a success and are here to support you. If you have questions or comments, urgent or non-urgent—or anywhere between—please send us a message via the 'Contact Us' button on each webpage or email us at contact@greeninja.org).

Grade Storyline

The theme for Grade 7 is Sustaining Life. The year begins with the Food Unit and follows the flow of energy from the Sun to plants and throughout the organisms in an ecosystem. Unit 2, Water, focuses on protecting people, other organisms, and infrastructure from dangerous floods. Unit 3, Humans and Life, is a study of genetic diversity and how it helps populations of organisms survive. The final unit, Exploring Early Earth, uncovers the processes of how Earth has changed over time.

We like to think of each unit as a student journey. The journey begins with a challenge—a real-world, locally relevant problem that students are tasked with solving. Students proceed through their journey as they learn the core knowledge through scientific and engineering practices and by utilizing recurring themes and concepts—the three components of the TEKS. The end of the journey is the culminating project, where students showcase how they met the unit challenge. The unit challenge, culminating in an end-of-unit project, is what drives students learning.

Here is a brief outline of the units in Grade 7:

Current Page Number(s): Skills & Themes Bank (TEKS 7.1-7.5), Item 34, p 12

Location: Question and Answer choice A

Original Text: "A recent thunderstorm damaged the roof of the local junior high school. The school board spoke with several contractors about repairing the roof. They also researched the average amount of time between repairs for each company. The table shows the estimated cost for each company and the amount of time before the next repair is needed. The school is expected to be used for at least an additional 50 years.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1877 of 3538

A. This is incorrect because while the roof costs less and has a somewhat long warranty, if the roof is done by this company, it will likely have to be repaired replaced at least five more times during the life of the school. There is a better option."

Updated Text: "A recent thunderstorm damaged the roof of the local junior high school. The school board spoke with several contractors about replacing the roof. They also researched the average period between roof replacements for each company. The table shows the estimated cost for each company and the amount of time before the next replacement is needed. The school is expected to be used for at least an additional 50 years.", "A. This is incorrect because while the roof costs less and has a somewhat long warranty, if the roof is done by this company, it will likely have to be replaced at least five more times during the life of the school. There is a better option."

Current Page Number(s): p. 206

Location: Column 2, Teacher Background, Paragraph 2

Original Text: "For students who use everyday definitions of heat but struggle with understanding heat as a process of energy transfer, help them talk through the concept of words that have several different meanings. In common language, heat is usually a property. In scientific language, it is always a process. Discuss similarities and differences in the different uses of the word. Provide students opportunities to practice using the scientific definitions of ordinary words in their speaking and writing."

Updated Text: "Review the scientific definition of heat with students and compare its scientific meaning with the everyday use of the word. Have students share examples of the word being used in sentences and discuss whether the example is an everyday use or the scientific use. For example, "Heat the kettle on the stove" is an everyday use of the

word. "Heat was transferred by radiation from the sun to Earth" is a scientific use of the word. Remind students to keep the scientific meaning in mind during energy transfer discussions."

Location: Between heading and Image gallery interactivity

Original Text: N/A

Updated Text: "Scientists sort organisms into three domains based on their characteristics: Domain Archaea, Domain Bacteria, and Domain Eukarya. Domain is the highest level of taxonomic classification. The organisms within domains can

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1921 of 3538

also be sorted into kingdoms.

[bullet] Domain Bacteria is made up of prokaryotes that usually have a cell wall and usually reproduce by cell division. All organisms within Domain Bacteria are also part of Kingdom Bacteria.

[bullet] Domain Archaea is also made up of prokaryotes, but they differ from other prokaryotes in their genetics and the makeup of their cell walls. All organisms within Domain Archaea are also part of Kingdom Archaea.

[bullet] Domain Eukarya is made up of all eukaryotes. This domain includes four kingdoms: Kingdom Protista, Kingdom Fungi, Kingdom Plantae, and Kingdom Animalia."

Location: Omission: Throughout the lessons there are "Key Ideas" for teachers. The key ideas tell teachers what to listen for in group discussions and guide teachers into introducing new terms or ideas if they are not explained by students. For example, in Lesson 1 Day 1 of Unit 7.1, the Key ideas suggest that teachers introduce the idea of "gas bubbles" if it isn't raised by students. This helps teachers to understand the barriers or misconceptions to students conceptual development.

ARTIFICIAL SELECTION IN DOGS Students investigate how to select dog parents to cross to obtain offspring with specific traits. Humans often choose to breed plants and animals with certain characteristics to produce desired traits in the offspring. Students then apply their understanding of selective breeding to answer questions about artificial selection and its effects on populations.

- If necessary, remind students that artificial selection is used to breed both plants and animals.
- To extend student learning, you could ask students to research a plant and an animal that has been developed through artificial selection. Have students prepare a slide presentation that describes the desired traits of the organism they researched.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1953 of 3538

Original Text: Revisit Anchoring Phenomenon

As a class, discuss how the Everyday Phenomenon relates to the Anchoring Phenomenon. Students should note that the longhorn cattle's horns changed size due to natural and artificial selection. This relates to the idea that offspring do not always resemble their parents. Longhorn cattle offspring with shorter horns would be less likely to survive and reproduce than those with longer horns since the horns were naturally selected for, even though the cattle were also artificially selected for the long horn trait.

Direct students to revisit their Claim-Evidence-Reasoning chart and revise it based on discoveries they have made during this Experience.

Updated Text: Revisit Anchoring Phenomenon

As a class, discuss how the Everyday Phenomenon relates to the Anchoring Phenomenon. Students should note that the longhorn cattle's horns changed size due to natural and artificial selection. This relates to the idea that offspring do not always resemble their parents. Longhorn cattle offspring with shorter horns would be less likely to survive and reproduce than those with longer horns since the horns were naturally selected for, even though the cattle were also artificially selected for the long horn trait. Students should also indicate that the zedonk in the Anchoring Phenomenon may also be due to artificial selection and since the donkey and zebra reproduced asexually, the zedonk has traits from each parent but does not look identical to either one.

Direct students to revisit their Claim-Evidence-Reasoning chart and revise it based on discoveries they have made during this Experience.

Location: Launch the Anchoring Phenomenon

Original Text: Launch the Anchoring Phenomenon

Students watch a video that introduces the phenomenon of a bath bomb dissolving in water. Throughout the Topic, students learn to compare and contrast elements and compounds and this knowledge will help them explain that the bath bomb and the water are compounds. Students also learn to distinguish between physical and chemical changes in matter and this knowledge will help them identify that a chemical change occurs as the bath bomb, a solute, dissolves in the water, a solvent.

Anchoring Phenomenon Video

. . . Students may have trouble explaining what is going on, since there is something a bit like an explosion occurring.

Updated Text: Launch the Anchoring Phenomenon

Students watch a video that introduces the phenomenon of a bath bomb dissolving in water. Throughout the topic, students recognize that, like all matter, the bath bomb is composed of elements and compounds. They compare and contrast elements and compounds in terms of chemical symbols and chemical formulas, and they identify atoms in a chemical formula using a periodic table. Students distinguish between the evidence of chemical and physical changes that they observe as the bath bomb dissolves and produces bubbles. Students also describe the aqueous solution of a bath bomb in water in terms of solvent, solute, and concentration. Students model the factors that affect the rate of dissolution of the bath bomb in water.

Anchoring Phenomenon Video

Students may have trouble explaining what is going on, since it may appear that something like an explosion is occurring.

Component: *Grade 7 Teacher Guide*

ISBN: 9781418398668

Current Page Number(s): 16

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1961 of 3538

Original Text: Use these strategies to help students make sense of the images and text, as well as to engage science skills.

- Refer students back to the Interpreting Distance-Time Graphs section of the text. Ask What does the first segment show? (It shows a constant speed away from the starting point.)
- Direct students to look at the first segment and the last segment. Ask What is similar about the first and last segments of the graph? What is different? Encourage students to look at their text for supporting evidence. (The first segment shows a steady motion away from the starting point, and the last segment shows a return to the starting point at a faster speed.)

Updated Text: Use these strategies to help students make sense of the images and text, as well as to engage science skills.

- Refer students back to the Interpreting Distance-Time Graphs section of the text. Ask What does the first segment show? (It shows that the object is moving at a constant speed of 15 km/hr.)
- Direct students to look at last two segments of the graph. Ask What is different about the object's motion in the third and fourth segments of the graph? Encourage students to look at their text for supporting evidence. (The third segment has a steeper slope, so it shows faster speed. The fourth segment has a shallower slope, so it shows a slower speed.)
- Draw students' attention to the graph with the sandpiper. Students should understand that the bird is going back and forth toward and away from the water, not moving across the beach. Have students identify what is indicated on the vertical (y) axis and the horizontal (x) axis. Ask How is this graph different from the graph on the first page? (It has displacement on the y axis instead of distance; it has lines with positive slope and negative slope.) Ask In the displacement-time graph, what does positive slope mean? What does negative slope mean? (Positive slope means that the object is moving away from the starting point; negative slope means that the object is moving back toward the starting point.)

Component: Grade 7 Student Activity Companion

ISBN: 9781418398637

Current Page Number(s): 103

Location: Heading Interpreting Distance-Time Graphs and art, and art text

Original Text: A distance-time graph plots an object's distance from a starting point over time. Distance is on the vertical (y) axis, and time is on the horizontal (x) axis. The slope of a graph at a point is the steepness of the graph at that point. If the graph is a line segment, the slope of that segment is calculated as "the rise over the run," or the change in y divided by the change in x. Slope may be positive or negative. In both cases, steepness of the slope reflects speed. For an object with a constant speed, the graph would only be a straight line. But if the speed of the object varies, a graph is an excellent way to show the changes. Graphs are also a good way to identify patterns in motion.

Label 1

The positive slope of the first segment indicates motion away from the starting point.

Label 2

The steeper slope of the third segment shows a higher speed than in the first segment.

Label 3

The negative slope of the fourth segment indicates that the object is returning to the starting point.

Updated Text: A distance-time graph plots the distance an object travels over time. Distance is on the vertical (y) axis, and time is on the horizontal (x) axis. The slope of a graph at a point is the steepness of the graph at that point. If the graph is a line segment, the slope of that segment is calculated as "the rise over the run," or the change in y divided by the change in x. The slope of a line can vary. In a distance-time graph, a steep slope indicates a faster speed, while a shallow slope indicates a slower speed. For an object with a constant speed, the graph would be a steady line. But if the speed of the object varies, its slope will become steeper or shallower. Graphs also help to identify patterns in motion. (Graph was updated so that the last segment with a negative slope was changed to a positive slope.)

Label 1

The positive slope of the first segment indicates that the object is traveling over a distance.

Label 2

The steeper slope of the third segment shows that the object is moving at a higher speed than in the first segment.

Label 3

The shallower slope of the fourth segment shows the object is moving at a slower speed.

Location: Heading Plotting Distance-Time Graphs

Original Text: Graphing motion requires knowing where an object is at a given time. If speed is steady, a straight line can be drawn through the plotted points. Of course, you want to be sure to define your starting point and positive and negative distance when you make a graph.

Graphing Nonuniform Motion For a more complicated case of motion, the distance-time graph can be irregular. For example, the way a sandpiper moves up and down on a beach is represented by a jagged line.

Distance

Updated Text: Graphing motion requires knowing the distance a moving object has traveled at a given time. If an object's speed is steady, a straight line can be drawn through the plotted points. Of course, you want to be sure to define your units of time and distance when you make a graph.

A displacement-time graph shows the velocity of a moving object. The vertical (y) axis shows the displacement rather than distance. A negative slope means that the object is moving back toward the starting point.

Graphing Nonuniform Motion This displacement-time graph represents the way a sandpiper moves toward and away from the water on a beach. Note that the sandpiper is moving only forward and backward, not right or left.

Original Text: Q1

A distance-time graph shows how an object's distance from a starting point changes over time.

Speed is equal to the value of the _____ of the line on a distance-time graph.

If the slope is positive, the distance from the starting point is _____.

If the slope is negative, the distance from the starting point is _____.

If the slope is zero, the distance from the starting point is _____.

Which terms, in order of appearance, best complete the sentences about distance-time graphs?

- A. slope; decreasing; decreasing; decreasing
- B. [Answer: slope; increasing; decreasing; not changing]
- C. x-axis; not changing; increasing; not changing
- D. x-axis; decreasing; not changing; increasing

Q5

Between which two times is the toy car moving at the greatest acceleration?
Explain your answer.

Scoring Rubric:

1 pt: Student identifies the time interval with the fastest speed as 9–11 s.

1 pt: Student explains that the value of slope is equal to speed.

1 pt: Student explains that the steeper the slope, the higher the speed.

The car is moving fastest between 9–11 s. . . .

Updated Text: Q1

A distance-time graph shows how the distance an object travels changes over time.

Speed is equal to the value of the _____ of the line on a distance-time graph.

If the slope is flat, the object's speed is _____.

If the slope is shallow, the object's speed is _____.

If the slope is steep, the object's speed is _____.

Which terms, in order of appearance, best complete the sentences about distance-time graphs?

Original Text: Teacher Notes

How can you interpret a distance-time graph?

Teacher Support

Use the first slide to ask students to make some initial observations about the graph. Then use the second slide to define slope and the different types of slopes that appear. Ask What does the vertical axis show? (distance from a starting point) What does the horizontal axis show? (time) Explain • When the slope is positive, the line slants upward from left to right; distance increases with time. That means the object is moving away from the starting point, so velocity is positive. • When the line is flat, the object has zero speed. The distance-time graph of a car that is stopped at a red light will have a plateau. The longer that flat line, the longer the object is motionless. • A steeper slope means greater speed. • When a line slants downward from left to right, it means the object is moving back toward the starting point. If it drops all the way back to the x-axis, the 2 • object is back at the starting point. Ask Could you find a vertical line on a distance-time graph? Explain why or why not. (It is impossible because a vertical line would mean the object moves a distance without any time passing. It would be in many places at the same time. But depending on the scales of the graph, a slope could look very steep.)

Updated Text: graph revised so that final line segment has a positive slope

Teacher Notes

How can you interpret a distance-time graph?

Teacher Support

Use the first slide to ask students to make some initial observations about the graph. Then use the second slide to define slope and the different types of slopes that appear.

Ask What does the vertical axis show? (distance from a starting point) What does the horizontal axis show? (time)

Explain

When the distance an object travels increases with time, the line slants upward from left to right: we say the slope is positive. A steeper slope means greater speed.

A steeper slope means greater speed—the object is traveling faster. A shallower slope means less speed—the object is traveling slower.

When the line is flat, we say it has a flat or zero slope. A flat slope means the object has zero speed (it has stopped). The distance-time graph of a car that is stopped at a red light will have a plateau. The longer that flat line, the longer the

object is motionless.

Ask Could you find a vertical line on a distance-time graph? Explain why or why not. (It is impossible because a vertical line would mean the object moves a distance without any time passing. It would be in many places at the same time. But depending on the scales of the graph, a slope could look very steep.)

Original Text: Teacher Notes

How can you plot a distance-time graph?

Teacher Support

Use the first slide text to ask students to make some initial observations of the two distance-time graphs. Use the second slide to discuss what the different graphs represent.

Ask What do you make of the up-and-down shape of the second graph shown here? What does it tell you about the object? (Something was moving away from and back toward the starting point, four different times.)

Explain

- The upper graph shows a swimmer's progress and speed.
- The lower graph shows a sandpiper, a small shorebird, moving toward the water to find food, and then scurrying away as waves come in. Because some waves wash farther up the beach than others, the second and third peaks on the graph are smaller. The bird has less time and space in which to run toward the water and peck at the sand for food.

Ask What do you think the flat plateaus on the graph represent? What was the

9
bird doing? (standing in place and pecking at the sand; not moving toward or away from the water)

Try It Out

Develop Models As a class, have a student model the motion of the sandpiper while others record distances and time. The student can be tasked with some kind of feeding activity, such as picking up twenty marbles or pennies at three pre-determined "feeding grounds" set at specific distances from a starting point.

Updated Text: y-axis label changed to "Displacement"

How can you plot a distance-time graph?

Teacher Support

Use the first slide text to ask students to make some initial observations of the two distance-time graphs. Use the second slide to discuss what the different graphs represent.

Ask What is different between the first graph and the second graph? (The first graph has "distance" on the y axis; the

second graph has "displacement" on the y axis. The first graph has a straight line going up, but the second graph has a jagged line going up and down.) If the second graph shows displacement, what does the jagged line tell you about the object's motion? (The object was moving away from and back toward the starting point, four different times.)

Explain

The upper graph shows a swimmer's progress and speed.

The lower graph is a displacement-time graph. It shows the velocity of a moving object. The vertical (y) axis shows the displacement (distance from a specific starting point). The horizontal (x) axis shows time. This graph can have a positive, zero, or negative slope. In a displacement-time graph, a negative slope means that the object is moving back toward the starting point.

This graph represents the way a sandpiper (a small shore bird) moves toward and away from the water on a beach. It moves toward the water and stops to find food, then it scurries away as waves come in. Some waves wash farther up the beach than others, so the second and third peaks on the graph are smaller. The bird has less time and space in which to run toward the water and peck at the sand for food.

Ask What do you think the flat plateaus on the graph represent? What was the bird doing? (standing in place and pecking at the sand; not moving toward or away from the water)

Try It Out

Develop Models As a class, have a student model the motion of the sandpiper while others record distances and time.

The student can be tasked with some kind of feeding activity, such as picking up twenty marbles or pennies at three pre-determined "feeding grounds" set at specific distances from a starting point.

Original Text: Objective

- Students will identify and model the main functions of the human circulatory and respiratory systems.

Updated Text: Objectives

- Students will identify the main functions of the human circulatory and respiratory systems.
- Students will use models to examine the parts of the human circulatory and respiratory systems and their interdependence in the function of the human organism.

Component: *Grade 7 Teacher Guide*

ISBN: 9781418398668

Current Page Number(s): 223

Location: Revisit Everyday Phenomenon

Original Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. During the class discussion, do not focus on wrong or right answers. Instead, ask students to explain their reasoning. Other students may then join the discussion to add their logic or provide different perspectives. Ask students to revise their initial answers now that they have completed the Explain activities. Consider pairing students and have them discuss the changes each of them made to their initial answers.

Updated Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. During the class discussion, do not focus on wrong or right answers. Consider pairing students and have them discuss the changes each of them made to their initial answers. Remind students that their final answers should explain why life as we know it is not possible on Venus.

Updated Text: Remind students of the question they were asked at the start of the Experience. Students considered why humans can't live on Venus, even though it is considered Earth's twin. During the class discussion, do not focus on wrong or right answers. Instead, ask students to explain their reasoning. Encourage students to join the discussion to add their logic or provide different perspectives based on activities from the experience, such as the Data Analysis activity where students examined the characteristics of Earth that support living things. Ask students to revise their initial answers now that they have completed the Explain activities. Consider pairing students and have them discuss the changes each of them made to their initial answers. Remind students that their final answers should explain why life as we know it is not possible on Venus.

Component: *Grade 7 Teacher Guide*

ISBN: 9781418398668

Current Page Number(s): 424

Location: Exit Ticket

Original Text: Have students draw and label a diagram of Earth. They should use labels and captions to explain how the planet supports life. As an alternative exit ticket, have students write a 5–6 sentence paragraph that explains the conditions that support life on Earth.

Updated Text: Have students draw and label a diagram of Earth. They should use labels and captions to explain how the planet supports life.

Alternative Exit Ticket Have students write a 5–6 sentence paragraph that explains the conditions that support life on Earth.

Component: *Grade 7 Teacher Guide*

ISBN: 9781418398668

Current Page Number(s): N/A

Location: Launch the Anchoring Phenomenon

Original Text: Students watch a video that introduces the phenomenon of human impact on water resources. Throughout the Topic students will gain knowledge that should help them explain that many products used by humans, like detergents, contain harmful products that go down the drain and make their way into surface water, groundwater, and the ocean. These pollutants impact the health of the organisms in aquatic environments and the quality of the water we consume, cook with, and bathe in.

Updated Text: Students watch a video that introduces the phenomenon of human impact on water resources. Throughout the Topic students will investigate sources of surface water and groundwater. Students will also explore aspects of resource management and how humans can impact water systems on Earth. This knowledge will help them explain that many products used by humans, like detergents, contain harmful products that go down the drain and make their way into surface water, groundwater, and the ocean. Students will explore human dependence on ocean systems and understand that pollutants impact the health of the organisms in aquatic environments and the quality of the water

we consume, cook with, and bathe in.

Component: *Grade 7 Teacher Guide*

ISBN: 9781418398668

Current Page Number(s): N/A

Location: Blue Objective box

Original Text: Objective

- Students learn about surface water in a watershed and how human activity can benefit or harm it.

Updated Text: Objectives

- Students will identify beneficial and harmful effects of human activity on surface water in a watershed.
- Students will develop models and conduct experimental investigations to investigate cause-and-effect relationships involving surface water and human activity.

Component: *Grade 7 Teacher Guide*

ISBN: 9781418398668

Current Page Number(s): N/A

Location: Revisit Everyday Phenomenon

Original Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. During the class discussion, do not focus on wrong or right answers. Instead ask students to explain their reasoning. Other students may then join the discussion to add their logic or provide different perspectives. Ask students to revise their initial answers now that they have completed the Explain activities. Consider pairing students and have them discuss the changes each of them made to their initial answers.

Updated Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. During the class discussion, do not focus on wrong or right answers. Instead ask students to explain their reasoning. Other students may then join the discussion to add their logic or provide different perspectives. Ask students to revise their initial answers about the Barton Springs salamander now that they have completed the Explain activities. Consider pairing students and have them discuss the changes each of them made to their initial answers. Students should conclude that human activities can negatively impact surface water which in turn can affect the health of the Barton Springs salamander.

Updated Text: Idea Boxes

Idea boxes placed throughout the chapter text function to provide opportunities for collaborative discussion of content, review of content introduced, and focus on certain content that is harder to grasp. Guidance on how to use the idea boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by:

- Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support).
- Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box.
- Planning to have at hand any materials needed to implement the Idea box.
- Reviewing the task information contained within the Idea boxes.

Location: Item: Location of Deserts

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2017 of 3538

Original Text: Why are deserts located in a band around Earth? Deserts are located in a band around Earth where the winds bring dry air onto land. Most deserts are located just above or below the equator, where warm air is rising. This takes away any moisture there might be, creating the dry desert. Air masses that interact in these areas are usually dry, continental air masses that increase arid conditions.

Updated Text: Why do deserts form in bands around Earth? Most deserts are located in the mid-latitude bands around Earth. This happens because of how air masses move and interact. As warm, wet air masses from the equator rise and travel away from the equator, they create precipitation over the tropics and eventually dry out before they fall over the mid-latitudes. These causes deserts to form in the mid-latitude bands around Earth.

Location: Phenomenon Check-In

Original Text: How can the average temperature be so different in places located about the same distance from the equator? Air masses move air and water at different temperatures around the globe. The tilt and rotation of Earth also influence where the warm air moves.

What causes weather differences in Canada and England? Many factors influence weather in these countries. So far, we know that moving air masses can influence the local weather a lot."

Updated Text: How can the average temperature be so different in places located about the same distance from the equator? In addition to latitude, surfaces over which air masses move impact the weather. If an air mass moves over large continental areas, the resulting weather is much different than that from an air mass moving over an ocean.

What causes weather differences in Canada and England? Many factors influence weather in these countries. Air masses in Canada move over a very large continent. Air masses in England move over a very small island after having moved over an ocean. The surfaces over which these air masses move impact the weather in very different ways.

Original Text: See Updated_Text for new content to add before the Item: Comparing Waves

Updated Text: Sound Wave Model A wave diagram is a type of scientific model. Why are sound waves sometimes represented by a diagram of a transverse wave? Select two.

- A. Sound waves are a type of transverse wave.
- B. Sound waves have repeating patterns like transverse waves.
- C. Both sound waves and transverse waves move up and down.
- D. Diagrams of transverse waves are easier to create.
- E. Diagrams of transverse waves show all properties of a wave.

[Correct answers: B, D]

Location: Unit 4 > Concept 1 > lesson 3 > Interact

Original Text: Launch the interactive and complete the following steps.

Select an organelle and read about its function.

Record the function of the organelle in your data table.

Predict if the organelle is found in plant cells, animal cells, or both.

Check your prediction by placing the organelle into the cells on the interactive. Some will go in both cells, and some will go in only one.

Record where each organelle is found in your data table.

Repeat the steps for each organelle.

Updated Text: Launch the interactive and complete the following steps.

1. Scroll down the images and descriptions of the organelles, noting the names and functions of each organelle.
2. Record the function of each organelle in your data table.
3. Predict whether specific organelles are in plant cells, animal cells, or both.
4. Check your prediction by dragging the organelle into the cells. Some will go in both cells, and some will go in only one.
5. Record where each organelle is found in your data table.
6. Repeat the steps for each organelle.

Original Text: Student responses will vary. Possible answers include:

Genes and Alleles

How did so many rabbits come from only five rabbits?

Why are they different colors?

Why are most of the rabbits brown?

Punnett Squares-Probability

How can a litter of rabbits look so different?

Why are there only a few white and black bunnies in the whole group of bunnies?

Note: These questions are grouped together to correspond with the sequence in which students will learn the science ideas necessary to answer them during Explore.

Original Text: In a chemical reaction, at least one substance is changed into a different substance. A chemical reaction occurs only if chemical bonds break, atoms rearrange, and new chemical bonds form to create different molecules. Chemical reactions can be difficult to visualize, so scientists invented a system to represent the changes that occur.

Updated Text: In a chemical reaction, a substance changes into a new substance. A chemical reaction occurs when atoms rearrange to create different molecules. The process involves chemical bonds breaking or forming. We cannot see this process with our eyes, so scientists have invented a system to describe how substances change.

Original Text: • Why does the mass of the system decrease if matter is conserved in chemical reactions? The system lost mass because the reaction produced a gas (carbon dioxide), which escaped into the air. Had we been able to capture the gas and measure its mass, we could have demonstrated that the reaction followed the law of conservation of mass.

Updated Text: • Why does the mass of the system decrease if matter is conserved in chemical reactions? All chemical reactions obey the law of conservation of mass. In our experiments, the system lost mass because the reaction produced a gas (carbon dioxide), which escaped into the air. Had we been able to capture the gas and measure its mass, we could have demonstrated that the reaction followed this law.

Updated Text: Safety

Safety should be a top priority in any science activity. If you have questions regarding the safety practices of this activity, please ask your teacher for clarification. If there are any accidents, notify your teacher right away.

Wear goggles at all times during the investigation, should anything get in your eyes, go to the eyewash station and flush your eyes and then notify your teacher.

Do not touch your face

Tie back long hair

Wear your apron to protect your clothing

Wear your insulated gloves when handling hot or heated up objects

Keep your area free and clear of any clutter

Clean up after your investigation as instructed by your teacher.

Be aware of the location of the fire extinguisher and fire blanket. Notify your teacher of an emergency immediately.

Safety should be a top priority in any science activity. If you have questions regarding the safety practices of this activity, please ask your teacher for clarification. If there are any accidents, notify your teacher right away.

Wear splash goggles at all times

Wear gloves at all times

If anything spills, please notify your teacher

Do not directly inhale any odors

Keep your area clean and clear

Wear closed toed shoes

Do not touch your face or eyes during the investigation

If something gets in your eye, go to the eyewash station and flush your eyes, alert your teacher

Wash your hands after the investigation is complete

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2057 of 3538

Original Text: Sustainable transport systems (note the discussion about sustainability in the Background for Teachers section):

Meet the basic transportation needs of all individuals, businesses, and society.

Provide affordable access to all.

Operate safely and efficiently.

Support a competitive economy and balanced regional development.

Limit their impact on the environment (use renewable resources while minimizing the impact on the land and on the quality of life for those living or working nearby).

When students have agreed on a definition, write it on a flip chart and post it in the room. This will become one of the measures used to gauge the success of each proposal.

Updated Text: Have students do a think-pair-share to consider what components should be part of sustainable transportation. Give students time to come up with and share their ideas. Guide the class to come up with the following:

Meet the basic needs of all individuals, businesses, and society.

Must be affordable to all people.

Operate safely and efficiently.

Support balanced regional development.

Limit environmental impact (use renewable resources while minimizing the impact on the land and on the quality of life for those living or working nearby).

Must be cost effective.

Ask students to consider what the term cost effective means in terms of transportation. Students may suggest that this means the transportation is affordable for all people to use. This is true, transportation that is cost effective provides efficient transportation at the lowest possible cost. However, there are many factors to consider. Let's look at the cost effectiveness of a \$500 bicycle that lasts for 5000 miles as an example. (Note that more expensive bikes can last more than 30,000 miles.) Write the equation on the board and do a talk aloud as you work through the math:

First, divide the cost of the bike by the number of miles it can be ridden before a person might need a new bike.

Cost per mile = $(\$500 \div 5000) = \$0.10/\text{mile}$

Explain that there is more to consider. For example, it usually takes longer to bike than drive, so we have to consider the cost of people's time, which reduces cost effectiveness. However, biking has minimal negative environmental impact, which increases cost effectiveness. Each of these contributes to the overall cost effectiveness of riding a bike. Inform students that cost effectiveness is an important consideration when designing sustainable transportation systems.

After the discussion, write the components of sustainable transportation on a flip chart and post it in the room. This will serve as students' definition of sustainable transportation, and will become one of the measures used to gauge the effectiveness of each proposal. Explain to students that for the culminating project, they will research multiple sources in order to evaluate each component of their sustainable transportation proposal.

Original Text: Green Ninja is delighted to present to you our Grade 8 integrated science curriculum. Our curriculum is designed around the TEKS and ELPS, and one of our primary goals is to make learning science fun and engaging. We take to heart the notion that giving students opportunities to work on real-world problems can promote science learning and student engagement and a full description of the research behind the curriculum and the instruction design is provided at <https://www.greenninja.org/texas/>. The core of the curriculum is helping to make science fun and interesting for students. Student motivation is a critical component of learning, so our goal is to help teachers make their classes as engaging for students as possible. We recognize that beginning to teach a new curriculum is not always a smooth process, so we've tried to make this shift to new territory as easy as possible. If you have any questions or comments, urgent or non-urgent, or anywhere in between, please send us a message (e.g., via the Contact Us button on each webpage or email at contact@greenninja.org). Grade Storyline The overall theme for the integrated Grade 8 curriculum is Dealing with Change. A brief outline of the year-long sequence of units and the associated culminating experiences is provided below. The year begins with Unit 1, Transportation, an investigation into how people get from one place to another using the principles of science. Students will develop an understanding of forces, energy transfer, and Newton's Laws of Motion. A roller coaster, a bicycle, and a hovercraft are all interesting forms of transport that obey the rules of science. In the culminating project, students will produce a proposal for a form of sustainable transportation. The topic for Unit 2 is Monarchs. Students learn of the story of Alejandra as she and her family observe changes in the migration patterns of monarch butterflies. The unit investigates possible causes for the changes—the relationships with milkweed, the monarchs' source of food, and the traits that are inherited. Students create a cell city to understand the structures and functions of cells. They learn to describe the processes of succession after an ecosystem disruption. The culminating project focuses on the survival of the monarchs. Unit 3, Weather and Climate, focuses on the physics of hurricane formation. To find out how hurricanes form, students will learn about the key drivers of weather, and then move on to climate. The lessons on the greenhouse effect lead into climate change, both natural and influenced by human activities. Students then learn about hurricanes and think about the future of hurricanes. Throughout the unit students will record weather data from three adopted cities. This data will be used in the culminating project, writing a 'cli-fi' story warning friends and family about future extremes in weather and climate. In Unit 4, The Universe, students return to a study of Earth as part of an enormous system. There have been debates about the formation of the universe and scientists continue to work at filling in the gaps in knowledge. Telescopes and electromagnetic waves have provided keys to learning about the universe. The focus moves to stars as they are born and change, as well as their positions in galaxies. There is a study of mass, not just in stars but also here on Earth as students learn about the state flower of Texas, the bluebonnet. In the final culminating project, students create a story that could change the world, and they present this story as a film in the Green Ninja Film Festival. By combining the global scale of our universe with the local challenges of sustainable living in our own community, the curriculum aims to help students understand the urgency of our challenges and realize the power of their own abilities to create the type of change they want to see in the world.

Updated Text: We are excited to welcome you to our Grade 8 curriculum for Texas! Green Ninja's approach to learning uses a storyline model where each unit begins with a locally relevant, real-world challenge and culminates in a project in which students showcase how they meet the challenge using the science they've learned in the unit. This is what drives student learning. As students proceed through the lessons, they'll use various scientific and engineering practices (SEPs) and recurring themes and concepts (RTCs) to help students build a cohesive understanding of science and the core ideas. Additionally, our curriculum meets all English Language Proficiency Standards (ELPS) to ensure that all learners have the opportunity to succeed. We want to make your teaching experience a success and are here to support you. If you have questions or comments, urgent or non-urgent—or anywhere between—please send us a message via the 'Contact Us'

Proclamation 2024: Report of Editorial Changes (11/08/2023)

button on each webpage or email us at contact@greenninja.org). Grade Storyline The theme for our integrated Grade 8 curriculum is Dealing with Change. The year begins with the Transportation Unit, where students investigate motion and energy and develop proposals for more sustainable transportation. In Unit 2, students study Monarchs and try to understand what is causing changes in monarch populations and behaviors. Unit 3, Weather and Climate, focuses on changes in Earth's weather and climate. The final unit, The Universe, explores how the universe is constantly changing, yet everything is connected. For the culminating project, students develop and create stories that could change the world. We like to think of each unit as a student journey. The journey begins with a challenge—a real-world, locally relevant problem that students are tasked with solving. Students proceed through their journey as they learn the core knowledge through scientific and engineering practices and by utilizing recurring themes and concepts—the three components of the TEKS. The end of the journey is the culminating project, where students showcase how they met the unit challenge. The unit challenge, culminating in an end-of-unit project, is what drives students learning. Here is a brief outline of the units in Grade 8:

Updated Text: "COMPARE: Complete the table to compare and contrast the properties of acids and bases. This includes comparing the pH of an acid and the pH of a base to the pH of water."

[new data table]

[First column:]

(title) Solution

Acid

Base

[Second column:]

(title) Physical properties

sour taste, conducts an electric current

bitter, slippery, conducts an electric current

[Third column:]

(title) Chemical properties

corrosive, reacts with many metals, reacts with acid-base indicators to signal the presence of an acid
caustic, reacts with acid-base indicators to signal the presence of a base

[Fourth column:]

(title) pH compared to water

lower pH than water, which is neutral and has a pH of 7
higher pH than water, which is neutral and has a pH of 7

Original Text: "3. One of the products of the chemical reaction between zinc and hydrochloric acid is hydrogen gas, but other reactions produce poisonous gases. What safety equipment and practices are important to use when working with gases released from chemical reactions? Select all that apply.

[answer]

- B. Keep test tubes pointed away from yourself and others.
- C. Use a fume hood when poisonous gases are involved in a reaction.
- D. Use your fingers to waft the chemical to your nose from 15 cm away."

Updated Text: "3. Even chemical reactions that start with safe reactants may form products that can be unsafe to handle. This is why appropriate safety equipment should be used at all times. [Goggles] protect(s) the eyes from chemical splashes. An apron prevents substances from staining or burning [clothing]. [Gloves] protect(s) the hands from spills if chemicals are improperly poured or handled. "

Original Text: "3. One of the products of the chemical reaction between zinc and hydrochloric acid is hydrogen gas, but other reactions produce poisonous gases. What safety equipment and practices are important to use when working with gases released from chemical reactions? Select all that apply.

- A. Immediately clean up any liquid spilled on the floor.
- B. Keep test tubes pointed away from yourself and others.
- C. Use a fume hood when poisonous gases are involved in a reaction.
- D. Use your fingers to waft the chemical to your nose from 15 cm away."

Updated Text: "3. Even chemical reactions that start with safe reactants may form products that can be unsafe to handle. This is why appropriate safety equipment should be used at all times. [Goggles] protect(s) the eyes from chemical splashes. An apron prevents substances from staining or burning [clothing]. [Gloves] protect(s) the hands from spills if chemicals are improperly poured or handled. "

Feedback

Partially Correct:

Try Again.

Goggles are worn over the eyes, an apron on the front of the body, and gloves on the hands.

Incorrect:

Try Again.

Think about where on the body each piece of safety equipment is worn. For example, gloves are worn on the hands.

Final Incorrect:

That's not it.

Goggles protect the eyes from chemical splashes, and an apron helps prevent stains or burns to clothing. Gloves protect the hands from accidental chemical spills.

Location: after Explain interaction

Original Text: N/A

Updated Text: "DESCRIBE: How do ocean currents and air masses interact to produce typhoons?
[answer] Warm ocean currents transfer energy and water to cooler air. This warm, moist air rises and condenses to form clouds, causing a drop in air pressure. Cooler air from high pressure areas moves toward the low pressure area. The process continues to increase the size of the clouds."

Current Page Number(s): p. 534

Location: Column 1, Step 2

Original Text: "STEP 2: Describe the sequential order of how an ecosystem changes over time during primary succession. Sample answer: Pioneer species are first to arrive in a disturbed area. These include lichens and mosses, which can grow on rock, concrete, or asphalt and break down those materials. Then, small plants like ferns, grasses, and wildflowers can live in the small pockets of soil created by the lichens and mosses. Grasses and wildflowers give way to shrubs and eventually to trees. Insects and small animals such as birds and rodents appear first with the grasses, and larger animals appear later, with the largest animals and predators appearing last."

Updated Text: "In quadrat sampling, scientists estimate the biotic or abiotic factors within a square or rectangular frame (the quadrat). Several quadrats are evaluated in an area to provide an overall understanding of the environmental factors in an area.

Quadrats can be square or rectangular frames made out of available material (plastic, wood, wire, cardboard). Quadrats should be big enough to capture detail in the environment students will investigate, but not so large that students will be unable to collect all the data within the given time."

Location: Omission: Assessment Opportunities: Throughout the lessons, teachers are provided "Assessment Opportunities". In this section, the lesson explains to teachers what to do if students don't understand the content. For example, in Lesson 7 Day 2 of Unit 8.1, the Assessment Opportunity explains how a teacher can help students revisit an investigation if they don't correctly answer Q3 or Q4. This guidance explains exactly what teachers should be listening for in student explanations and how to redirect students if there are gaps in student learning. These alternate activities are provided in most lessons to support teachers in recognizing barriers to student's conceptual development and always present ways to help students overcome these barriers

Location: Re-review: New content added. Please include the following as evidence added to the Course Unit Storylines and Teacher Guides. Information from the following page is added as a resource for teachers as a guide in using the instructional model to accommodate multilingual learners. The following is a direct quote from the text to be added, "OpenSciEd Instructional Model:

The instructional routines that make up the OpenSciEd Instructional Model provide many scaffolded opportunities for multilingual students to practice talking in partners, small groups, and then finally as a whole class.

Activities include options for students to express their ideas in many ways, with an emphasis on students using both linguistic (e.g., talking and writing) and non-linguistic (e.g., drawing, graphing) resources to share their thinking."

<https://www.opensci.ed.org/multilingual-learners/>

Since this evidence shows teacher guidance for linguistic accommodations, the score should be changed from PM to M.

HOW DO ADAPTATIONS HELP THE BIRD OF PARADISE FIND A MATE? Students can watch the video, or you can project and play the video. Then they can preview the image in their activity sheet or you can project the image from Realize. The background text explains that over thirty-five different species of birds-of-paradise live on the island of New Guinea. Use the following questions to guide student observation.

- Ask What adaptations do you think help male birds of paradise find a mate? (Students should say that the way they danced, moved their bodies, arranged their body, and their display of bright colors and long feathers aide in male bird's courtship of a female.)
- Have students brainstorm any related phenomenon they may have seen in their everyday lives or on vacations. Challenge students to take note of, draw, or photograph any related phenomenon they observe in their neighborhood or on their way to school. Invite students to share throughout the Experience.

In this topic, students describe how food webs are disrupted, how populations recover, and the impact of biodiversity on the stability of an ecosystem.

In Experience 1, students explain how disruptions such as population changes, natural disasters, and human intervention impact the transfer of energy in food webs. In Experience 2, students describe how primary and secondary succession affect populations and species diversity. In Experience 3, students describe how biodiversity contributes to the stability and sustainability of an ecosystem.

Students learned about how variations in populations can impact their ability to survive in Topic 7. They will build on their understanding in this topic as they consider the many ways that ecosystems can change and the impact these changes can have on populations.

Original Text: Hands-On Lab

HOW DOES SUCCESSION PREDICT FUTURE CHANGES IN AN ENVIRONMENT? In this field investigation, students will locate examples of secondary succession. To do this, students will perform a field investigation to find evidence of secondary succession. Prior to their fieldwork, students will create a data table to record their observations and evidence of succession. Then, using their data, students will provide evidence of succession. Students will also make predictions about the effect of a disruption that wipes out all species and compare it to the impact of the disruption they've observed.

Location: Preview the Topic

Original Text: In this topic, students will use models to explain the classification of matter and the conservation of mass in chemical reactions. Students will also develop explanations about the properties of water and will compare and contrast the properties of acids and bases.

In Experience 1, students are introduced to the classification of matter into elements, compounds, and mixtures. In Experience 2, they discover why water is such an important compound by examining its unique properties.

In Experience 3, they classify certain compounds according to whether they are acids or bases, based on their properties. Finally, they examine chemical reactions and how such reactions exhibit conservation of matter.

In Grade 6, students learned about physical properties of matter and distinguished between pure substances and mixtures. In Grade 7, students learned about elements and compounds and contrasted them in terms of chemical symbols and chemical formulas (TEKS 7.6A). They contrasted chemical and physical changes of matter (TEKS 7.6C). They will build on that knowledge in this Topic as they investigate the classification of matter and the conservation of mass in chemical reactions.

Updated Text: In this Topic, students will use models to explain the classification of matter and will investigate the conservation of mass in chemical reactions. Students will also develop explanations about the properties of water and compare and contrast the properties of acids and bases. In Experience 1, students investigate the classification of matter as elements, compounds, and mixtures. In Experience 2, they explore the properties of water. In Experience 3, they compare and contrast acids and bases based on their properties. Finally, in Experience , they investigate conservation of mass in chemical reactions. In Grade 6, students learned about physical properties of matter and distinguished between pure substances and mixtures.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

In Grade 7, students learned about elements, compounds, chemical symbols, and chemical formulas (TEKS 7.6A). They contrasted chemical and physical changes of matter (TEKS 7.6C). They will build on that knowledge in this Topic as they investigate the classification of matter and the conservation of mass in chemical reactions.

Original Text: Demonstration If students struggle to determine the relationship between the Anchoring Phenomenon and the Everyday Phenomenon, place a piece of limestone in a beaker containing an acidic solution. Most common driveway gravel is limestone, and it should be readily found in nature. Have students take pictures immediately after the rock is placed in the acid and a day later. Have them compare the pictures and summarize what happens.

Challenge

Rock pH Using the demonstration above, have students who need a challenge use a pH meter or pH paper to determine the pH of the solution as soon as the rock is placed in the acid and again after the rock sits for a day in the acid. Have them use what happens in the demonstration to explain any changes in pH.

Updated Text: STRIVING Demonstration If students struggle to determine the relationship between the Anchoring Phenomenon and the Everyday Phenomenon, place a piece of limestone in a beaker containing an acidic solution. Most common driveway gravel is limestone, and it should be readily found in nature. Have students take pictures immediately after the rock is placed in the acid and a day later. Have them compare the pictures and summarize what happens.

CHALLENGE Rock pH

Using the demonstration above, have students who need a challenge determine what soil amendments could modify the pH of the soil and improve the growing conditions for the plants in acidic or alkaline conditions. Encourage students to research the conditions in their own region and the needs of different plants, such as cranberries, broccoli, etc. Students can research and describe how they would modify local soil and conditions to grow a chosen crop.

Original Text: Noise in the Workplace Noise is unwanted sound, and it can be harmful to hearing if it is too loud. Exposure to loud noise is a major hazard in many workplaces. Repeated exposure to high noise levels can cause hearing stress and hearing loss. Some employers provide hearing protection to workers. However, that is not an option if communication is needed in a workplace. Installing quieter equipment and structures that reduce the amplitude of sound waves is the most effective way to reduce noise levels in the workplace.

Updated Text: Seismic Architecture Since 1900, more than 2,800 earthquakes have shaken Texas. In 2022, there were more than 220 earthquakes of magnitude 3.0 or higher. Seismologists use the amplitude of seismic waves to calculate an earthquake's magnitude. Earthquakes produce different types of seismic waves, including surface waves, which occur near Earth's surface. Surface waves, which are transverse waves, are the most destructive type of seismic wave. Engineers at Texas A & M University research seismic architecture for buildings and bridges. They use shake tables to mimic seismic waves so they can test their engineering designs. They can control variables like amplitude and frequency to determine their effect on structures. Students can research seismic architecture designs or even design and test their own models.

Original Text: Students watch a video that introduces the phenomenon of Texas experiencing more hurricanes than Maine. Throughout the Topic, students will gain knowledge that should help them explain that hurricanes typically form in warm, tropical waters in the Atlantic or near the Gulf of Mexico, where Texas is located. Texas is in the path of trade winds that move hurricanes from east to west.

Updated Text: Students will analyze data and use evidence to develop explanations about factors that lead to the development of hurricanes and cause more hurricanes to make landfall in Texas than in Maine. Students watch a video that introduces the phenomenon of Texas experiencing more hurricanes than Maine. Throughout the Topic, students will gain knowledge that should help them explain that hurricanes typically form in warm, tropical waters in the Atlantic or near the Gulf of Mexico, where Texas is located. Texas is in the path of trade winds that move hurricanes from east to west.

Component: *Grade 8 Teacher Guide*

ISBN: 9781418398675

Current Page Number(s): 168

Location: Objectives section top of page

Original Text: Objective

Students will explore how solar energy, the hydrosphere, and the atmosphere interact and influence weather and climate.

Updated Text: Objectives

- Students will use models to investigate how solar energy, the hydrosphere, and the atmosphere interact and influence weather and climate.
- Students will identify patterns and analyze data to describe how solar energy, the hydrosphere, and the atmosphere interact and influence weather and climate.

Component: *Grade 8 Teacher Guide*

ISBN: 9781418398675

Current Page Number(s): 178

Location: Objectives section top of page

Original Text: Objective

- Students will describe how solar energy, hydrosphere, and atmosphere interact and influence weather and climate.
- Students will identify global patterns of atmospheric movement and how they influence local weather.

Updated Text: Objectives

- Students will use models to explain how solar energy, hydrosphere, and atmosphere interact and influence weather and climate.
- Students will investigate global patterns of atmospheric movement and use data to explain how they influence local weather.

Component: *Grade 8 Teacher Guide*

ISBN: 9781418398675

Current Page Number(s): 185

Location: Revisit Everyday Phenomenon

Original Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience.

During a class discussion, do not focus on wrong or right answers. Instead, ask students to explain their original reasoning for their answers. Other students may then join the discussion to add their logic or provide different perspectives. Ask students to revise their initial answers now that they have completed the Explain activities. Consider pairing students and have them discuss the changes each of them made to their initial answers and answer the questions they posed.

Updated Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. During a class discussion, do not focus on wrong or right answers. Instead, ask students to explain their original reasoning for their answers. Other students may then join the discussion to add their logic or provide different perspectives. Ask students to revise their initial answers now that they have completed the Explain activities. Consider pairing students and have them discuss the changes each of them made to their initial answers and answer the questions they posed. Students should understand that the air in the atmosphere presses down on everything beneath it, causing atmospheric pressure. The flat newspaper and the crumpled paper have the same mass, but when the flat paper is placed on top of the ruler, a lot more air presses on the surface of the paper. This pins the ruler in place and makes it harder to knock off the desk.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2151 of 3538

Original Text: Objective

- Students will explore the interactions among ocean currents and air masses that produce tropical cyclones.
- Students will explore where tropical cyclones, hurricanes, and typhoons form.

Updated Text: Objectives

- Students will investigate the interactions among ocean currents and air masses that produce tropical cyclones.
- Students will use models to represent where tropical cyclones, hurricanes, and typhoons form.

Component: *Grade 8 Teacher Guide*

ISBN: 9781418398675

Current Page Number(s): 205

Location: Revisit Everyday Phenomenon

Original Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. Students should now revise their explanations based on information indicated by the symbols on the weather map and what they have learned about the cause-and-effect relationship between weather fronts and weather. Ask students to revise their initial answers now that they have completed the Explain activities. Consider pairing students to discuss revisions.

Updated Text: Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. New explanations should reflect an understanding that hurricanes, also known as tropical cyclones, form in conditions of low atmospheric pressure when warm, moist air rises over ocean water. As more air rises, winds start to form, eventually developing into a tropical storm and then a hurricane. Hurricanes get stronger over warm ocean water and weaken over cold ocean water. They also weaken after they make landfall. Students should understand that tropical cyclones can occur in different regions of the world and that they may be called typhoons or cyclones based on where they occur. Ask students to revise their initial answers now that they have completed the Explain activities. Consider pairing students to discuss revisions.

Location: Preview the Topic

Original Text: In Experience 1, students are introduced to natural events that can impact global climate. They explore the carbon cycle and become familiar with the use of scientific evidence to describe how volcanic eruptions, meteor impacts, and abrupt changes in ocean currents influence climate. In Experience 2, they explore how human activities, such as the release of greenhouse gases, deforestation, and urbanization, influence climate.

Updated Text: In this Topic, students will plan and conduct an experimental investigation to identify the cause-and-effect relationship between carbon dioxide in the atmosphere and warmer average global climate. Students will use scientific evidence and analyze data to examine factors that can affect global climate. In Experience 1, students are introduced to natural events that can impact global climate. They explore the carbon cycle and become familiar with the use of scientific evidence to describe how volcanic eruptions, meteor impacts, and abrupt changes in ocean currents influence climate. In Experience 2, they explore how human activities, such as the release of greenhouse gases, deforestation, and urbanization, influence climate.

Students learned about weather and climate in Grade 4. In Grade 7, they learned about thermal energy transfer and the cycling of matter in ecosystems. In this Topic, they will build on their prior knowledge to understand how natural events and human activity can impact climate.

Component: *Grade 8 Teacher Guide*

Original Text: REVISIT EVERYDAY PHENOMENON

Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience.

During the class discussion, encourage students to share their original choices and explain their reasoning. Then ask students if they want to choose another explanation now that they have completed the Explain activities, especially to add evidence from the Experience to their explanation. Consider having students form small groups to discuss the changes each of them made to their initial answers.

EXIT TICKET

Give students 3–5 minutes to create a story board or story outline about a natural event that influences climate. As a class, discuss each response and any

revisions that should be made.

As an alternative exit ticket, ask students to answer the following questions:

- Which is part of the carbon cycle?
 - a. Carbon is taken in by plants during photosynthesis.
 - b. Forest fires and burning fossil fuels release CO₂ into the atmosphere (correct).
 - c. Carbon enters the geosphere when organisms die and decay.
 - d. All of the above
- Give a thumbs up if you think that an abrupt change in an ocean current can cause the climate to change because ocean currents moderate Earth's climate by moving warm water away from the equator and cold water toward the equator. (thumbs up)

Updated Text: REVISIT EVERYDAY PHENOMENON

Direct students to go back to the Everyday Phenomenon Activity they completed at the start of this Experience. During the class discussion, encourage students to share their original choices and explain their reasoning. Then ask students if they want to choose another explanation now that they have completed the Explain activities, especially to add evidence from the Experience to their explanation. Students should conclude that B is the best explanation. Volcanoes emit materials that disperse for great distances. These materials reflect sunlight back into space, which can lead to lower a lower global temperature.

EXIT TICKET

Give students 3–5 minutes to create a story board or story outline about a natural event that influences climate. As a class, discuss each response and any revisions that should be made.

Alternative Exit Ticket Ask students to answer the following question:

Which is part of the carbon cycle?

- a. Carbon is taken in by plants during photosynthesis.
- b. Forest fires and burning fossil fuels release CO₂ into the atmosphere.
- c. Carbon enters the geosphere when organisms die and decay.
- d. All of the above (correct).

boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by:

- Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support).
- Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box.
- Planning to have at hand any materials needed to implement the Idea box.
- Reviewing the task information contained within the Idea boxes.

the [notebook] to fall. Repeat with another object. Ask: Did I cause the [pencil] to fall?

Advanced/Advanced High Have a student volunteer help you to demonstrate. Place a notebook in front of you and another in front of the student. Have the student push the notebook off the desk onto the floor. Don't push your notebook. Ask: Who caused a notebook to fall? Ask students to explain their answer

Updated Text: Beginning Push a notebook off your desk. Say: I caused the notebook to fall. Have students write using the word cause. Use the following sentence frame: You _____ the notebook to fall. Repeat with another object, repeating what you did, and have students chime in with cause along with you. Provide students with a sentence frame to write about the second object.

Intermediate Push a notebook off your desk. Say: I caused the notebook to fall. Repeat with a pencil. Ask: Who caused the pencil to fall? Have students write using the word cause. Use the following sentence stem: When you moved the pencil, _____. Sample answer: you caused it to fall

Advanced/Advanced High Have a student volunteer help you to demonstrate. Place a notebook in front of you and another in front of the student. Have the student push the notebook off the desk onto the floor. Don't push your notebook. Ask: Who caused the notebook to fall? Have students write using the word cause. Sample answer: My classmate caused the notebook to fall.

Updated Text: TEKS Pill 1.1E, 1.1F

Component: McGraw Hill Ciencias para Texas, Grado 1 Teacher Edition

ISBN: 9781266115707

Current Page Number(s): 272

Location: Question and answer under Interactive Word Wall heading

Original Text: Ask: Can you describe a life cycle? Sample answer: the stages a living thing goes through during its life

Updated Text: Say: Describe your observations of the fish life cycle. How can you record your observations? Sample answer: A fish starts life as an egg and changes as it grows. I can draw pictures of the different ways fish look as they grow.

Component: McGraw Hill Ciencias para Texas, Grado 1 Teacher Edition

ISBN: 9781266115707

Current Page Number(s): 273

Location: Teach, Investigation Connection, Notebooking

Original Text: After reading, students build on what they have learned by looking back to compare the life cycles of the animals they read about to the life cycles of the fish, bird, and mammal they explored during the simulation. They should be able to indicate that the life cycles of all the animals follow the same order.

Updated Text: After reading, students build on what they have learned by looking back to compare the life cycles of a goose and a chicken.

Component: McGraw Hill Ciencias para Texas, Grado 1 Teacher Edition

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2286 of 3538

Original Text: Guided Inquiry

Provide the explorable question. Ask: How can a pantry be organized to help make it easy to find ingredients? Example Students might choose to incorporate organization tools such as organizer bins or can rack organizers into their designs. Investigations must answer the explorable question.

Updated Text: Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question. Ask: How can a pantry be organized to help make it easy to find ingredients?

Example Option 1: Students can sort the food by sizes of the containers they are in. They could put all of the larger containers together and all of the smaller containers together. Option 2: Students can sort the food by the type of food it is. They could put all of the spices together in a group. All of the pasta could go together in another group. The cereal could make another group. Then consolidate the others into another group. Option 3: The students could sort the food by wet and dry food. Option 4: The students could introduce food storage solutions and sort the food using food containers.

Original Text: Remind students to push the ball rather than throwing it. It may help to demonstrate pushing the ball down the ramp so students know what is expected. Encourage students to be safe when pulling the box. They should use only the force necessary to pull the box. Excessive force could cause falls. You may want to set this investigation up in a large open area like the gym.

Updated Text: You may want to set this investigation up in a large open area like a gymnasium. Remind students to push the ball rather than throw it. Location: Visual Literacy

Original Text: Read the Map Guide students through the See-Scan-Analyze thinking process.

Ask: What do you see? Sample answer: A map of Texas that has sections shaded in different colors. Ask: What do the colors represent? How do you know? Sample answer: The colors represent different amounts of average annual rainfall. I saw the key that shows which color stands for which amounts of rainfall. Ask: What questions come to mind as you look at this graph? Sample answer: Do the ecosystems in these areas receive precipitation other than rain?

Updated Text: Read the Graph Guide students through the See-Scan-Analyze thinking process.

Ask: What do you see? Sample answer: I see a bar graph that compares the rainfall between a desert and a rain forest. Ask: What do the bars on the graph represent? Sample answer: The bars on the graph represent the rain fall in inches in the different locations. Ask: What questions come to mind as you look at at this graph? Sample answer: Do the ecosystems in these areas receive precipitation other than rain?

Current Page Number(s): p. 6

Location: Topic 1 Overview, Preview the Topic

Original Text: En este tema, los estudiantes aprenden sobre la materia. En la Experiencia 1, investigan las propiedades de la materia, incluyendo la textura, la flexibilidad y la temperatura. En la Experiencia 2, investigan los cambios en la materia a través de procesos como cortar, doblar, lijar, derretir y congelar. En la Experiencia 3, demuestran que la materia puede estar formada por objetos que, a su vez, están constituidos por unidades más pequeñas, y que esas unidades pueden combinarse o reensamblarse para formar nuevos objetos con distintos fines. También explican por qué los materiales se eligen en función de sus propiedades físicas.

Updated Text: (Inserted second paragraph below existing content.)

A medida que progrese en el tema, conecte las actividades con lo que los estudiantes aprendieron en el grado 1. Los estudiantes pueden aplicar lo que aprendieron en el tema 1 sobre clasificar objetos mediante las propiedades observables (TEKS 1.6A) y las propiedades de las partículas en distintos tipos de suelos (TEKS 1.10A) a lo que están aprendiendo en el tema 1 sobre propiedades como la textura (TEKS 2.6A). Pueden basarse en lo que aprendieron sobre los cambios en los materiales mediante el calentamiento (TEKS 1.6B, 1.8B) y aplicarlo en lo que están aprendiendo sobre los procesos que cambian la materia en el tema 1 (TEKS 2.6B).

Component: *Guía del maestro*

ISBN: 9781323223468

Current Page Number(s): p. 38

Location: Topic 2 Overview, Preview the Topic

Original Text: En este tema, los estudiantes aprenden sobre la fuerza y el movimiento. Primero, en la Experiencia 1, investigan cómo los objetos se empujan unos a otros y cómo pueden cambiar de forma cuando se tocan o se chocan. Luego, en la Experiencia 2, los estudiantes investigan cómo la intensidad de un empujón o un jalón puede cambiar el movimiento de un objeto.

Updated Text: (Inserted second paragraph below existing content.)

A medida que progrese en el tema, conecte las actividades con el tema 1, La materia. Los estudiantes pueden aplicar lo que aprendieron en el tema 1 sobre las propiedades físicas observables de la materia (TEKS 2.6A) y cómo las propiedades se pueden cambiar mediante procesos como doblar (TEKS 2.6B) para explicar cómo los objetos se empujan entre sí y pueden cambiar de forma cuando se tocan o colisionan (TEKS 2.7A).

Original Text: "... . Pídales que observen el agua cuando comienza a evaporarse y tomen notas sobre sus observaciones, si lo desean."

Updated Text: "... . El tiempo necesario para que hierva el agua puede variar según la hornilla. Pídales que observen el agua a medida que comienza a hervir y evaporarse, y que presten atención a cómo cambia el agua. Muchos estudiantes pueden pensar que el vapor es evidencia de la evaporación. El vapor de agua, o la forma gaseosa del agua, es invisible y es diferente del vapor. El vapor es evidencia de agua en el aire que se condensa y se vuelve visible. Pida a los estudiantes que identifiquen la ebullición como un cambio observable en el agua a medida que se calienta. El agua se evapora cuando hierve. Otra evidencia de evaporación sería una disminución en la cantidad total de agua en el vaso de precipitados."

ISBN: 9781266117770

Current Page Number(s): 14A

Location: 2nd Column, Make a Plan section

Original Text: Make a Plan

Steps 1–4 To help students select a design, show them photos of bridges and advise them to look for common design features. The amount of materials needed will be an estimate because students may discover that they need more supplies as they begin construction of their bridge. As students construct their bridge, remind them to focus on making the bridge strong so that it can withstand the weight of as many pennies as possible. Students will take pictures of their completed prototype. TEKS 3.1B

- Steps 5–8 Advise students to place the pennies on the bridge carefully instead of dropping them onto the bridge. Students will record results in their data table.
- Steps 9–11 Students evaluate their original bridge design and propose solutions for improvements. Then, they implement their improvements and test the new bridge design. TEKS 3.2D, 3.3A

Communicate Information

Have teams share and communicate their results to the class. What patterns can they identify based on what designs held the most pennies?

Updated Text: Make a Plan/Develop the Design

Steps 1-2 To help students select a design, show them photos of bridges and advise them to look for design features to sketch a plan. Students choose the materials needed to begin the construction of their bridge. As students construct their bridge, remind them to consider all of the factors that will impact the stability of the bridge, including the materials used and the weight of each penny. Students should focus on making their bridge withstand as many pennies as possible. TEKS 3.1B, 3.5G

Steps 3-5 Students will use their sketch to build the prototype according to the requirements. Students will take photos of their completed prototype.

Test the Design/Improve the Design

Steps 6-9 Advise students to carefully place the pennies on the bridge instead of dropping them until it collapses. Students will record results in their data table.

Steps 10-12 Students evaluate their original bridge design and propose solutions for improvements. Then, they implement their improvements, test the new bridge design, and record the results. TEKS 3.2D, 3.3A

Steps 10-12 Students evaluate their original bridge design and propose solutions for improvements. Then, they

Current Page Number(s): 14B

Location: Left column, Example

Original Text: Students might investigate how the placement of the pennies on the bridge affects how many pennies the bridge will hold.

Investigations must answer the explorable question.

Updated Text: 1. Build a stable gumdrop bridge that spans 15 cm using gumdrops, craft sticks, toothpicks, pennies, a ruler, and an index card.

2. Brainstorm and research shapes for a sturdy design to go across a 15 cm gap.

3. Choose a shape and plan how to put it together.

4. Build bridge #1 and test it with washers.

5. Improve the design and build bridge #2 and test it with washers.

5. Record your results in the data table.

Component: McGraw Hill Ciencias para Texas, Grado 3 Teacher Edition

ISBN: 9781266117770

Current Page Number(s): 14B

Location: Left column, Open inquiry

Original Text: Students write their own explorable question.

Ask: What questions did you have when you evaluated your bridge design?

Plan the Investigation Make sure students choose a testable question. Ask: Can your question be investigated through research, observation, modeling, and/or experimentation?

Updated Text: Students identify their own problem.

Ask: What problem could you solve using the Engineering Design Process?

Plan the Investigation Make sure students choose an engineering design problem they can solve using the resources available.

Current Page Number(s): 60B

Location: Guided Inquiry

Original Text: Guided Inquiry

Provide the explorable question. How can you demonstrate building a stronger brick based on the physical properties of the materials used?

Example Students may wish to mix other materials into the sand. They may also decide on different methods of determining its strength.

Updated Text: Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question. How can you demonstrate building a stronger brick based on the physical properties of the materials used?

Example Step 1. Measure the damp sand and dry sand, then mix the two together. Step 2. Measure the water and add to the sand mixture. Step 3. Mix the sand and water mixture until it is mixed thoroughly. Step 4. Once you have the correct consistency of water and sand, pour the mixture into the brick mold. Step 5. Gently wiggle the mold and remove the sand brick.

Location: Right column, Identify and Brainstorm a Solution

Original Text: Identify

Students should use their observations to answer the explorable question. Ask: How can you make a useful object out of recycled materials?

Brainstorm a Solution

Encourage group members to share their ideas about what objects could be made out of different used materials.

Updated Text: Identify a Problem/Brainstorm a Solution

Ask: How can you make a useful object out of recycled materials?

Students should discuss and record potential solutions to the problem. They will choose one solution to develop in the following steps. Encourage group members to share their ideas about what objects could be made out of different used materials.

Current Page Number(s): 222B

Location: Left Column, Guided and Open Options and Guided Inquiry box

Original Text: Guided and Open Options

For guided and open inquiry, students are expected to develop materials lists, write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Guided Inquiry

Provide the explorable question. Ask: How can you make a useful object out of recycled materials?

Example The class might choose to agree on a common purpose or problem and then have student groups design and assemble objects that meet the purpose or solve the problem. Investigations must answer the explorable question.

Updated Text: Structured and Open Options

For structured inquiry, students are given a procedure. For open inquiry, students are expected to develop materials lists, write procedure steps, and determine how they will share their results. Revisions are likely during their investigation.

Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question. Ask: How can you make a useful object out of recycled materials?

Example Step 1. Observe the recycled materials and decide which materials to use to design a new object that will serve a

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2373 of 3538

purpose. Step 2. Sketch your design using those materials. Step 3. Build the new object out of the recycled materials selected. Step 4. Test your prototype. Step 5. Adjust prototype for improvements.

Updated Text: (inserted Enseñanza dirigida box)

Si tiene estudiantes que no han alcanzado el dominio a nivel de grado de los conceptos de esta Experiencia, intente lo siguiente:

Pida a un voluntario que infle un globo. Pase el globo inflado para que lo observen. Invite a los estudiantes a que comenten qué es lo que ocupa espacio dentro del globo.

Dé a los estudiantes tarjetas y clips para que observen. Inicie un debate sobre las propiedades físicas de los dos objetos. Pida a los estudiantes que hagan una predicción acerca de si la tarjeta o el clip serán magnéticos. Pídales que usen un imán para probar si los objetos son magnéticos. Pregunte a los estudiantes si una tarjeta o un clip son livianos o pesados para su tamaño. Pídales que prueben si cada objeto flotará o se hundirá en el agua.

Current Page Number(s): p. 224

Location: Column 2, Práctica matemática, paragraph 1 and Apoyo para las respuestas de los estudiantes, Práctica matemática

Original Text: "Una gota de lluvia es mucho más grande que una gota de agua y que una partícula de polvo. Por ejemplo, una partícula de polvo es muy pequeña comparada con una gota de lluvia. Usa la tabla para ordenar los elementos e identificar cuánto más pequeña es una partícula de polvo que una gota de lluvia.

Apoyo para las respuestas de los estudiantes

Práctica matemática: Las fracciones muestran los tamaños de las partículas de polvo y de las gotas de agua en relación con el tamaño de las gotas de lluvia. En la columna del medio, ordena las fracciones en orden de menor a mayor. Luego, coloca los elementos que corresponden a esa fracción del tamaño de una gota de lluvia. Respuesta: gota de lluvia $1/1$, gota grande $1/20$, gota de tamaño medio $1/100$, partícula de polvo $1/5000$ "

Updated Text: "Brinde apoyo a los estudiantes al ordenar las fracciones por tamaño. Ayúdelos a comprender que los denominadores más grandes con numeradores iguales indican partes más pequeñas de un entero. Luego, pueden usar la información de las imágenes para relacionar los elementos con su tamaño relativo.

Apoyo para las respuestas de los estudiantes

Práctica matemática: Usa la tabla para ordenar los elementos e identificar cuánto más pequeña es una partícula de polvo que una gota de lluvia. Las fracciones muestran los tamaños de las partículas de polvo y de las gotas de agua en relación con el tamaño de las gotas de lluvia. En la columna del medio, ordena las fracciones de menor a mayor. Luego, coloca los elementos que corresponden a esa fracción del tamaño de una gota de lluvia. Respuesta: $1/5000$ de una partícula de polvo, $1/100$ de una gota promedio, $1/20$ de una gota grande, $1/1$ de una gota de lluvia"

Location: Column 2, El ciclo del agua, Apoyo para las respuestas de los estudiantes, top half of page

Original Text: "Muestra dónde se producen la evaporación, la condensación, la precipitación y la escorrentía. Usa flechas para conectar el flujo de agua en el ciclo. Respuesta de ejemplo: El estudiante dibuja una flecha desde el agua hasta el sol para representar la evaporación. El estudiante dibuja una flecha desde la evaporación hasta las nubes para representar la condensación. El estudiante dibuja una flecha desde el agua hasta el sol para representar la evaporación. El estudiante dibuja una flecha desde la montaña hasta el arroyo para representar la escorrentía."

Updated Text: "Usa flechas para mostrar cómo es el ciclo del agua al pasar por la evaporación, la condensación y la precipitación. Rotula las flechas como "evaporación", "condensación" y "precipitación". Las flechas de los estudiantes deben mostrar la evaporación desde el agua hasta el cielo despejado, la condensación desde el cielo despejado hasta las nubes y la precipitación desde las nubes hasta el agua."

Original Text: "Activar conocimientos previos pidiendo a los estudiantes que vean las imágenes que dan comienzo a cada día en esta lección. Pídeles que identifiquen los cambios en la superficie terrestre que se muestran en cada imagen. En el Grado 3, los estudiantes adquirieron conocimientos sobre los cambios en la superficie terrestre ocasionados por las erupciones volcánicas, los terremotos y los deslizamientos de tierra. Pida a los estudiantes que repasen los efectos que tienen estos tres eventos sobre el terreno, el suelo y las rocas."

Updated Text: "Activar conocimientos previos pidiendo a los estudiantes que exploren la imagen del ciclo del agua. En las lecciones anteriores, los estudiantes aprendieron sobre el ciclo del agua, sobre cómo se mueve el agua en y por encima de la superficie terrestre. El agua provoca algunos de los cambios en la superficie terrestre que los estudiantes explorarán en esta lección. Pida a los estudiantes que repasen los procesos del ciclo del agua, lo que incluye la evaporación, la condensación y la precipitación."

Provide the explorable question. Ask: How can you use paper to prevent an egg from breaking when dropped?

Example Students might design a device to catch the egg rather than designing a carrier. Investigations must answer the explorable question.

TEKS 4.1B

Updated Text: Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question. Ask: How can you use paper to prevent an egg from breaking when dropped?

Example

Step 1. Observe the materials for building a device to keep the egg from breaking when dropped from two meters. Step 2. Brainstorm what device can be made with the available materials. Step 3. Build the device. Step 4. Find an area and test the device. Step 5. Compare the design with others and think of ways to improve the design. Step 6. Repeat brainstorming and improving the design to help make the egg drop successful.

Original Text: Guided Inquiry

Provide the explorable question. Ask: How can you separate matter that has been mixed together?

Example Students might use additional tools to help separate the mixture such as cheese cloth and water to dissolve the salt. They might use a heat lamp to help evaporate the water. Investigations must answer the explorable question.

Updated Text: Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question.

Ask: How can you separate matter that is mixed together?

Step 1. Observe the mixture in the bowl and think about the physical properties of each individual substance. Step 2. Determine what tools to use to separate the mixture into individual parts. Step 3. Use tools to begin separating the mixture until all substances are separated. Step 4. Observe other groups and think about how you can improve on your design.

Location: Column 2, Circuitos y sistemas, paragraph 1

Original Text: N/A

Updated Text: "Apoyo para las respuestas de los estudiantes

Haz un modelo de un circuito completo de un foco e incluye todas las partes del sistema. Luego, dibuja un segundo modelo, pero deja una interrupción en el circuito eléctrico. Rotula tus modelos para mostrar cómo funcionan las partes interdependientes del sistema, centrándote en lo que le ocurre al foco en cada circuito.

El primer modelo de los estudiantes debe mostrar un bucle completo que incluya una fuente de energía y un foco. El segundo modelo debe incluir partes similares, pero con una interrupción en el circuito. Los rótulos deben mostrar que la trayectoria es necesaria para hacer un circuito completo. Los estudiantes deben identificar la fuente de energía y que el foco transforma la energía eléctrica en calor y luz."

Updated Text: "Apoyo para las respuestas de los estudiantes

Investiga el CAD como solución innovadora. Enumera tres aspectos en los que el CAD ha mejorado la sociedad. Respuesta de ejemplo: El CAD ha acelerado el proceso de desarrollo y lo ha hecho más barato, de modo que es posible obtener soluciones a los problemas en menos tiempo. El CAD les permite a los diseñadores modificar y optimizar sus soluciones de manera fácil, por lo que las soluciones cuestan menos dinero cuando llegan al público. Los diseñadores usan CAD para hacer productos más seguros."

Updated Text: Muchas de las propiedades físicas observables y comprobables pueden usarse para comparar y contrastar otra materia, además de la que se estudia en las investigaciones.

Tal es el caso de cierta materia sólida, como las rocas. Los sólidos tienen un volumen definido y no adoptan la forma del recipiente que los contiene. Los líquidos, como el agua, también tienen un volumen definido, pero asumirán la forma del recipiente en el que se encuentran. Por ejemplo, al verter leche del cartón a un vaso, esta cambia de forma. Los gases, como el aire, no tienen un volumen fijo. Estos se expandirán para ocupar el recipiente que los contiene.

Otra propiedad que se puede usar para comparar y contrastar materia es el magnetismo. Un imán atraerá clips metálicos. La mayoría de los no metales, como el plástico y la madera, no serán atraídos por el imán.

Location: Paso 1, Paso 2, Paso 3 y Paso 4 paragraphs

Original Text: "Paso 1 Usa las proporciones para preparar tu modelo. Llena parcialmente el molde para asar de modo que tenga unos dos tercios de arena. Deja vacío un tercio del fondo del molde.

Paso 2 Dibuja con el dedo un "río" en la arena. Luego, usa los libros para elevar el lado arenoso del molde para asar.

Paso 3 Usa el mapa secuencial que aparece más adelante en esta actividad para mostrar el aspecto actual del molde para asar.

Paso 4 Ponte los lentes de seguridad. Vierte lentamente dos vasos de agua en el río, cerca de la parte superior del molde. Observa lo que ocurre a lo largo del río y en la base del molde."

Updated Text: "Paso 1

Usa las proporciones para preparar tu modelo de río. Cubre el interior del rollo de toallas de papel con papel de aluminio. Llénalo parcialmente de modo que tenga unos dos tercios de arena. Asegúrate de que la arena tenga entre 5 y 7 cm de profundidad. Presiona la arena para que no se mueva.

Paso 2

Luego, usa los libros para elevar un lado del rollo de toallas de papel. Vierte agua en el fondo del molde para asar para formar un "océano". Coloca el rollo de toallas de papel de modo que la parte más baja se apoye en el molde, y el río desemboque en el océano.

Paso 3

Usa el mapa secuencial que aparece más adelante en esta actividad para mostrar el aspecto actual de tu modelo.

Paso 4

Ponte los lentes de seguridad. Vierte lentamente dos vasos de agua cerca de la parte superior del rollo, para que corra por el río. Observa lo que ocurre a lo largo del río y en la base del molde, en el océano."

Page 2500 of 3538

Location: ASSESS, Claim, Evidence, Reasoning, pink sample answer text

Original Text: Sample answer: solids, liquids, and gases are all made up of matter. The particles are arranged differently in each state.

Updated Text: particles of matter make up all states of matter, solids, liquids, and gases. Particles inside solids look closer together than in liquids, followed by gases. Gas particles are further apart and move more freely in a container compared to a solid. Gases can take the shape of their container, but solids keep their shape.

Original Text: all members of a food web play an important role. They provide food, eat food, or both. As a result, removing an organism affects the cycling of matter and flow of energy.

Updated Text: all members of a food web play an important role. They provide food, eat food, or both. As a result, removing an organism affects the cycling of matter and flow of energy. For example, grass provides food for elephants, rats, and insects. However, lizards can eat rats but also provide food for eagles. Removing an organism affects the cycling of matter and flow of energy. If you remove grass, it will decrease organisms that eat it for survival. Elephants that depend on grass might not survive.

Updated Text: (add after last sentence)

Si la prueba revela que los estudiantes aún no alcanzaron un dominio a nivel del grado del contenido de esta Experiencia, recuerde que puede asignar los recursos y actividades que apoyan los TEKS para brindar una intervención. Mire especialmente los recursos de "¿Tiene más tiempo?", aquellos que tienen una marca de un signo más y que están diseñados para el aprendizaje personalizado, como las lecturas del tema. También puede usar las actividades de "Enseñanza dirigida" para cerrar cualquier brecha de aprendizaje que encuentre.

Original Text: "[A] Transferencia de energía es el movimiento de energía de un objeto o lugar a otro.

[B] La transformación de energía es el proceso de cambio de energía de un tipo a otro.

[C] Un sistema es un conjunto de partes que interactúan entre sí; muchas veces es diferenciado de su entorno solo para poder estudiarlo.

[D] Una salida es información, material o energía que surge de un sistema o proceso.

[E] Una entrada es información, material o energía que se ingresa a un sistema o proceso. "

Updated Text: "[A] Un sistema es un conjunto de partes que interactúan entre sí; muchas veces es diferenciado de su entorno solo para poder estudiarlo.

[B] Una entrada es información, material o energía que ingresa a un sistema o proceso.

[C] Una salida es información, material o energía que surge de un sistema o proceso.

[D] La transferencia de energía es el movimiento de energía de un objeto o lugar a otro. La energía luminosa proveniente del sol se transfiere al sistema de un árbol. En el sistema del árbol, esta energía se transforma en energía química dentro del azúcar de los alimentos. La transformación de energía es el proceso de cambio de un tipo de energía a otro."

Location: Column 1, Diferenciación: Reto

Original Text: "Desafíe a los estudiantes a identificar las teorías científicas que han sido descartadas por el público porque son "sólo teorías." Por ejemplo, Galileo propuso la teoría de que la Tierra giraba alrededor del Sol, pero fue descartada por la gente que quería creer que la Tierra era el centro del universo. La tectónica de placas, el lavado de manos, la teoría de los gérmenes y la evolución son otras teorías que fueron descartadas. Pídales a los estudiantes que investiguen y expliquen por qué estas teorías científicas fueron finalmente aceptadas."

Updated Text: "Los científicos usan la palabra teoría para referirse a un sistema de ideas respaldadas por pruebas científicas que explican los fenómenos. Sin embargo, en el uso no científico, la palabra teoría tiene un significado menos riguroso, similar al significado de la palabra idea. Por ejemplo, alguien podría decir: "Mi teoría es que mi perro puede leer: mastica solamente las cajas que están dirigidas a mí". Esa persona está usando la palabra teoría para referirse más a una idea que a una teoría científica. Es una teoría que no está respaldada por pruebas controladas y evidencias considerables. Por otro lado, la Tectónica de placas, el lavado de manos, la teoría de los gérmenes y la evolución son ejemplos de teorías científicas porque están respaldadas por una gran cantidad de evidencias científicas reunidas por numerosos científicos durante muchos años. Desafíe a los estudiantes a seleccionar una teoría científica que les interese y a investigar algunas de las evidencias que la respaldan."

- comprensión de cómo distintas fuerzas pueden actuar sobre un objeto y afectarlo

[answer] Cuando comparé mi paracaídas y mis datos con los de otros grupos, descubrí que los paracaídas con un área más grande suelen ayudar a que el objeto caiga más lento. Para mejorar mi paracaídas, trataría de hacerlo más grande y más rectangular. Esto podría ayudar a aumentar la resistencia del aire y la fuerza ascendente sobre el paracaídas, lo que aumentaría la cantidad de tiempo que tardaría el objeto en caer."

Original Text: N/A

Updated Text: "EXPLICA: Explica cómo se conserva la materia en esta red alimentaria de un ecosistema. Incluye una explicación de por qué la cantidad de materia de la que se componen los productores puede no ser igual a la cantidad de materia de la que se componen los consumidores, pero aun así la materia se conserva en el sistema.

Respuesta de ejemplo: Cuando un consumidor come un productor u otro consumidor, la materia se transfiere al consumidor. La cantidad de materia que absorbe el consumidor es igual a la cantidad de materia que usa el consumidor para desarrollar su propio cuerpo y llevar a cabo los procesos vitales, más la materia que libera al medio ambiente como desecho. Como los organismos liberan desechos al medio ambiente, puede parecer que la materia no se conserva en una red alimentaria. Esta es una razón por la que la masa de los consumidores de los niveles más altos de una red alimentaria

es menor que la masa de los productores y los consumidores de los niveles más bajos. Pero la materia no se destruye, sino que se transfiere a otra parte del sistema."

Location: Column 2, REÚNE DATOS, question and answer text

Original Text: "REÚNE DATOS

¿Cómo afectan las posiciones de la Tierra, el sol y la luna a los ciclos diarios, semanales o mensuales de las mareas? Anota tus datos.

Respuesta de ejemplo: El sol y la luna se alinean en el mismo lado de la Tierra aproximadamente una vez al mes. Cuando se alinean, su gravedad provoca una marea más alta de lo habitual. Cuando el sol y la luna se encuentran en un ángulo de 90° con respecto a la Tierra, sus fuerzas gravitatorias no se suman y la amplitud de la marea es menor. Las mareas muertas se producen cada cuarto de luna o unas dos veces al mes."

Updated Text: "REUNIR DATOS

"¿De qué manera las posiciones y las fuerzas gravitacionales (o gravitatorias) de la Tierra, el Sol y la Luna causan...

- los ciclos diarios de las mareas?
- los ciclos semanales de las mareas?
- los ciclos mensuales de las mareas?

Anota los datos.

Respuesta de ejemplo: A medida que la Luna orbita alrededor de la Tierra, su atracción gravitacional afecta el ciclo diario de las mareas de la Tierra. Se produce un abultamiento en los lados de la Tierra más cercanos y opuestos a la Luna, lo que resulta en una marea alta y baja que ocurre dos veces al día. El Sol y la Luna se alinean en el mismo lado de la Tierra aproximadamente una vez al mes. Cuando están alineados, su gravedad hace que la marea sea más alta de lo normal. Cuando el Sol y la Luna se encuentran en un ángulo de 90° con respecto a la Tierra, sus fuerzas gravitacionales no se suman y la amplitud de la marea es menor. Las mareas muertas se producen cada cuarto de luna o unas dos veces al mes."

REÚNE DATOS

Updated Text: "Estudio de caso: La contaminación de la atmósfera"

IDENTIFICA: ¿Cuál es el problema o asunto central en este estudio de caso?

DESCRIBE: ¿Cómo contribuyó la mala administración de los recursos al problema del estudio de caso?

ANALIZA: ¿Cómo se relaciona el problema del estudio de caso con las actividades económicas humanas?

EVALÚA: ¿Cómo afecta negativamente el problema del estudio de caso a las personas y al medio ambiente? ¿Cómo se han reducido ya los efectos negativos de la actividad sobre las personas y el medio ambiente mediante las decisiones de administración de los recursos?

SUGIERE SOLUCIONES: Identifica y describe al menos una estrategia de administración de los recursos que las personas podrían usar para mejorar el problema presentado en el estudio de caso.

Respuesta de ejemplo: La contaminación de la atmósfera es el problema central. Las actividades humanas, como la quema de combustibles fósiles, han provocado un aumento del dióxido de carbono en la atmósfera. Que haya demasiado dióxido de carbono en la atmósfera puede afectar el clima de la Tierra. Un clima cambiante puede afectar negativamente la salud de las personas. El aumento de dióxido de carbono en la atmósfera también afecta los océanos de la Tierra, y los cambios en los océanos pueden dañar a los organismos de agua salada de los que las personas dependen para alimentarse. Si las personas pudieran reducir las emisiones de carbono mediante el uso de fuentes alternativas de energía, el problema podría mejorar.

[digital page lozenge]

Investiga la administración de los recursos y la pobreza

Comunicar información (6.3.B)

Patrones (6.5.A)

Apoyo para las respuestas de los estudiantes

Investiga soluciones para reducir la pobreza mediante la administración de los recursos.

- Los agricultores utilizan el suelo y el agua para sus cultivos. Las personas venden árboles y animales de los bosques, usan árboles y otros tipos de biomasa para encender fuego para cocinar, y pescan para comer o vender el pescado en pesquerías.
- La administración de los recursos se relaciona con la pobreza porque muchas personas dependen de los recursos naturales para su sustento. Cuando los recursos se administran de un modo que ayuda a las personas a satisfacer sus necesidades, la pobreza de una zona se puede reducir.
- Las estrategias de administración de los recursos pueden ayudar a reducir la pobreza al involucrar a las comunidades locales en la administración de los recursos naturales y el desarrollo de políticas económicas relacionadas con sus recursos naturales. Los ingresos que generan las comunidades pobres gracias a sus recursos naturales pueden aumentarse por medio del turismo o de iniciativas para comprar productos locales, incrementando la productividad de las tierras agrícolas o pagando a las comunidades para que conserven áreas en su estado natural para preservar los servicios ecosistémicos."

ANALIZA: ¿Cómo se relaciona el problema del estudio de caso con las actividades económicas humanas?

EVALÚA: ¿De qué manera las decisiones de administración de los recursos redujeron la pobreza en este ejemplo?

Respuesta de ejemplo: El tema central de mi ejemplo es la disminución de los humedales, necesarios para la pesca, en Bangladesh, un país cercano a la India, y la concentración de los ingresos de la pesca en un pequeño grupo de personas en vez de en la comunidad en general. Los humedales que se utilizan para pescar disminuyeron su calidad debido a una gestión indebida, y se permitió que los permisos de pesca fueran otorgados solo a un pequeño grupo de personas. El

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2568 of 3538

deterioro de la calidad ambiental de los humedales está vinculado a la contaminación y otros factores derivados de la urbanización. Los humedales se pudieron mejorar creando reservas, generando restricciones de cosecha y recolección, implementando pasajes para peces y aumentando el movimiento del agua. Una vez que los humedales mejoraron en tamaño y calidad, aumentaron las oportunidades de pesca, se incrementó la cantidad de peces atrapados y los ingresos por la venta de pescados ayudaron a las personas pobres de la zona."

Original Text: "COLABORA: Trabaja con un compañero o en un grupo pequeño para investigar sobre los vertederos y los patrones relacionados con los desechos sólidos y los vertederos en tu estado o país. Desarrolla una presentación sobre los vertederos para informar a tu comunidad de lo que ocurre con sus desechos sólidos.

¡Sé creativo! Puedes presentar tu exposición por escrito, con un dibujo o de forma oral. Busque: Las presentaciones de los estudiantes deben incluir una descripción de qué es un vertedero y cómo funciona. Deben incluir el proceso de lo que ocurre, desde que se deshacen de sus residuos sólidos hasta que entran en el vertedero. Los estudiantes pueden mencionar que es importante conservar los materiales debido a los efectos de los residuos sólidos que se acumulan en los vertederos."

Updated Text: "COLABORA: Trabaja con un compañero o en un grupo pequeño para investigar soluciones para reducir la eliminación de desechos sólidos y el uso de vertederos en tu estado o en el país.

- ¿Qué fuentes encontraste durante la investigación? ¿Cómo sabías que eran confiables?
- Describe tres soluciones que se usen actualmente para reducir la eliminación de desechos sólidos.
- Describe al menos una solución para reducir la eliminación de desechos sólidos que no esté generalizada ahora pero que tal vez lo esté en el futuro.
- Evalúa las soluciones que describiste para saber si son poco costosas; es decir, analiza la relación entre lo bien que funciona una solución y cuánto cuesta.

- ¿Qué solución es la forma menos costosa de reducir la eliminación de desechos sólidos?

En primer lugar, comunica oralmente tu solución a otro grupo. Luego, presenta tu solución a la clase en forma de dibujo, cartel o presentación digital de diapositivas. Trabaja con tu maestro o con otro miembro de tu comunidad para implementar la solución.

Busque: Las presentaciones de los estudiantes deben incluir una explicación de la solución que les parece la forma menos costosa de reducir la eliminación de desechos sólidos. Los estudiantes deben usar evidencias y materiales de apoyo para ilustrar por qué apoyan esta solución. Pueden mencionar que es importante conservar los materiales debido a los efectos de los desechos sólidos que se acumulan en los vertederos."

Original Text: Los estudiantes miran un video que presenta lo que le ocurre a la pizza cuando se cocina en el horno. A lo largo del tema, los estudiantes obtendrán conocimientos que los ayudarán a explicar los cambios físicos y químicos que se producen cuando la masa y otros ingredientes se convierten en una pizza.

Updated Text: (revised text)

Los estudiantes ven un video que muestra lo que sucede con la pizza mientras se cocina en un horno. A lo largo del tema, los estudiantes compararán los estados de la materia en términos de estructura y forma para analizar los cambios físicos de los ingredientes de la pizza. Los estudiantes también identificarán la formación de una nueva sustancia como evidencia de cambios químicos. Al investigar los indicadores de cambios físicos y químicos a lo largo del tema, los estudiantes comprenderán cómo la masa y otros ingredientes pueden combinarse físicamente, luego cocinarse y cambiar químicamente para convertirse en una pizza.

Location: Iniciar el fenómeno de anclaje paragraph

Original Text: Los estudiantes miran un video que presenta el fenómeno de cómo se utiliza el agua para hacer que una persona se levante en el aire. A lo largo del tema, los estudiantes obtendrán conocimientos que los ayudarán a explicar que el dispositivo de vuelo propulsado por agua ejerce una fuerza sobre el agua, y el agua ejerce la misma fuerza, pero en dirección opuesta sobre el dispositivo.

Updated Text: (revised text)

Los estudiantes miran un video que presenta el fenómeno del uso del agua para elevar a una persona en el aire. A lo largo del tema, los estudiantes identificarán cómo actúan las fuerzas sobre los objetos. Los estudiantes calcularán la fuerza neta sobre un objeto para determinar si las fuerzas están equilibradas o desequilibradas. Finalmente, los estudiantes identificarán pares de fuerzas simultáneas por medio de la Tercera ley de movimiento de Newton que les ayudará a explicar que el dispositivo de vuelo propulsado por agua ejerce una fuerza sobre el agua y que el agua ejerce una fuerza igual pero opuesta sobre el dispositivo.

Component: *Astronomy 1a/1b*

ISBN: 9781959433507

Link to Current Content:

[View Current Content](#)

Location: Astronomy 1b: Exploring the Universe, Unit 1, Lab, 4th bullet point at the end

Original Text: After learning about how astronomy has evolved over the years, from when it was first named by the ancient Greeks in 600 BCE to some of the more recent space travel missions, you have a nice broad overview of the history of astronomy and all that it entails.

However, sometimes exploring and looking at a topic in a more visual way can be helpful in your further understanding of it. Which is why for this lab you will take what you learned in the unit combined with plenty of online research to create a visual timeline that highlights some of the most significant events and moments in the history of astronomy.

Now, you may be thinking that a timeline that covers the history of astronomy all the way back to 600 BCE would be pretty extensive—but don't worry. You do not need to include everything significant over the history of astronomy's existence, more like 8-10 items to highlight.

You may choose any items over the long history of astronomy's existence between 600 BCE and now; however, these items/events should be somewhat spread out. For instance, do not choose five notable moments in the history of astronomy that all took place in the same year.

In addition to researching and choosing 8-10 notable moments in the history of astronomy for your timeline, you will need to find images to go along with each. The goal of this timeline is to create a chronological, visual, progression of astronomy over the years, which means that you will need more than just text.

However, you will still need text! For each item or event that you add to your timeline, you must include the following:

At least one image

The date and a title for the item/event

A brief description

Why you find this item or event notable in terms of the history of astronomy

Any other pertinent information about this item/event

Please include a list of the websites or resources that you used for research with your timeline.

For more information on how you will be graded, refer to the rubric below.

Updated Text: After learning about how astronomy has evolved over the years, from when it was first named by the ancient Greeks in 600 BCE to some of the more recent space travel missions, you have a nice broad overview of the history of astronomy and all that it entails.

However, sometimes exploring and looking at a topic in a more visual way can be helpful in your further understanding of it. Which is why for this lab you will take what you learned in the unit combined with plenty of online research to create a visual timeline that highlights some of the most significant events and moments in the history of astronomy.

Now, you may be thinking that a timeline that covers the history of astronomy all the way back to 600 BCE would be pretty extensive—but don't worry. You do not need to include everything significant over the history of astronomy's existence, more like 8-10 items to highlight.

You may choose any items over the long history of astronomy's existence between 600 BCE and now; however, these items/events should be somewhat spread out. For instance, do not choose five notable moments in the history of astronomy that all took place in the same year.

In addition to researching and choosing 8-10 notable moments in the history of astronomy for your timeline, you will need to find images to go along with each. The goal of this timeline is to create a chronological, visual, progression of astronomy over the years, which means that you will need more than just text. Choose moments in history that highlight the impact of past research on society, including the contributions of diverse scientists.

However, you will still need text! For each item or event that you add to your timeline, you must include the following:

- At least one image
- The date and a title for the item/event
- A brief description
 - o Name the scientist(s) (if applicable) and give a brief description of their background, anything that makes them a diverse voice in science, and where this research took place.
 - o Highlight how this research has impacted society over time.
- Why you find this item or event notable in terms of the history of astronomy
- Any other pertinent information about this item/event

When you have completed your timeline, choose one research-related astronomy event in history that you think has impacted society over time. Then, think about why the scientific community thought this research was valuable at the time. To think through this, perform a cost-benefit analysis on this past research study to determine if it was valuable. You may remember that a cost-benefit analysis analyzes both the costs (money, time, human resources, etc.) it takes to accomplish a project and the benefits (improving health, furthering a country's defense goals, etc.) that the project will achieve.

In your cost-benefit analysis, make sure to include the following:

- How much the research study would have cost during the time it was performed. Include as much information as you can find online!
- How this research impacted society at the time it was performed and throughout history.

State whether you believe the research study was worth it after analysing the cost vs the benefit. Make sure to explain your position! Please also include a list of the websites or resources you used for research with your timeline and cost-benefit analysis.

Location: Astronomy 1a: Introduction, Unit 6, Lab, 2nd bullet point

Original Text: While the unit offered a variety of interesting and important information regarding GAIA Mapping and how it is being used to create a detailed 3-D map of the Milky Way, there is SO much more to learn and discover about this incredible technology!

For this lab, you will be digging a bit deeper into the realms of GAIA mapping to discover not only how it applies to astronomy and the Milky Way, but also how it has been used for other types of mapping situations!

Start by researching GAIA mapping online—there is a lot of information available with numerous websites to choose from. You want to look for information about the European Space Agency’s (ESA) Gaia mission as well as other non-astronomy-based applications of GAIA mapping. Gather and collect all of the information that you can find on GAIA mapping, the ESA Gaia mission, and other ways that GAIA mapping is used.

Next, compile all of this information to create an informative and engaging slideshow presentation about GAIA. While you have complete creative freedom and control over how you design this presentation, you will need to include and address the following information:

A basic explanation of what GAIA mapping is

How the ESA is using Gaia mapping and the purpose of the ESA Gaia Mission

Other ways that Gaia mapping is being used outside of astronomy-related endeavors

Any additional information that you find that is interesting or relevant to Gaia mapping, either astronomy or non-astronomy based

You must also include a title slide with your name and the name of your presentation as well as a slide listing any and all websites and references that you used for your presentation. Though not required, feel free to use charts or images to further enhance your presentation.

For information on how you will be graded, please refer to the rubric below.

Updated Text: While the unit offered a variety of interesting and important information regarding GAIA Mapping and how it is being used to create a detailed 3-D map of the Milky Way, there is SO much more to learn and discover about this incredible technology!

- Any additional information that you find that is interesting or relevant to Gaia mapping, either astronomy or non-astronomy based

Scientists will often conduct a cost-benefit analysis on a research program or mission to determine whether a project is

worth the investment. To perform this sort of analysis, scientists must account for as many foreseeable costs as possible including equipment, personnel, and time. Then, they compare this cost projection against the overall benefits the program or study will bring to the scientific community and society as a whole.

In this lab, you will perform a cost-benefit analysis on GAIA. Gather information pertaining to the benefits and costs of this project and then include a slide in your presentation that compares the two. This slide must also include your opinion on whether the program is worth the cost and why.

You must also include a title slide with your name and the name of your presentation as well as a slide listing any and all websites and references that you used for your presentation. Though not required, feel free to use charts or images to further enhance your presentation.

Location: Astronomy 1a: Introduction, Unit 3, lab Video "Solar vs. Lunar Eclipses, Explained," Question 2

Original Text: Solar vs. Lunar Eclipses, Explained

Based on what you learned in the unit and the video, discuss what you know about solar eclipses.

In the unit and the video, we learned about the types of shadows that are cast on Earth and on the moon. Explain the two types of shadows and where they occur.

Why don't we see a total solar eclipse once a month? Explain your answer.

Discuss what nodes are and how they relate to both total solar and total lunar eclipses.

Why doesn't the moon turn black during a total lunar eclipse? Explain your answer.

Shifting Seasons

In recent years, there has been a lot of chatter about climate on Earth. In fact, some scientists believe that climate change is affecting and altering the traditional concept of the four seasons we have now. After reading the article, do some research on your own. Do you think climate change is affecting our seasons? Why or why not? Share the links you found that support your theory.

Updated Text: Solar vs. Lunar Eclipses, Explained

1. Based on what you learned in the unit and the video, discuss what you know about solar eclipses.
2. In the unit and the video, we learned about the types of shadows that are cast on Earth and on the moon. Explain the two types of shadows and where they occur.
3. In the video, the narrator modeled how the relative position of the Moon and the Sun can cause the Moon to appear differently in our sky throughout the course of a year (these are referred to as lunar phases). Draw a model that represents how the relative position of the Moon causes lunar phases.
4. Why don't we see a total solar eclipse once a month? Explain your answer.
5. Discuss what nodes are and how they relate to both total solar and total lunar eclipses.
6. Why doesn't the moon turn black during a total lunar eclipse? Explain your answer.

Shifting Seasons

In recent years, there has been a lot of chatter about climate on Earth. In fact, some scientists believe that climate change is affecting and altering the traditional concept of the four seasons we have now. After reading the article, do some research on your own. Do you think climate change is affecting our seasons? Why or why not? Share the links you found that support your theory.

Location: Astronomy 1a: Introduction, Unit 3, Lesson 2, "The Cycle of Seasons" subheading, text beginning "The hemisphere of Earth that is tilted..."

Original Text: The Cycle of Seasons

Have you ever noticed that it gets dark in the winter much earlier in the day compared with the summer? The hemisphere of Earth that is tilted toward the Sun receives more hours of sunlight in each day than the hemisphere that is tilted away from the Sun. This longer period of sunlight is one reason why summer is warmer than winter.

A picture of a street is shown and broken up into four vertical slices, with a different season featured in each slice. The elliptical nature of the Earth's orbit causes the seasons to occur.

The Earth revolves around, or orbits, the Sun in an elongated, closed-curved path called an ellipse. The rate of revolution around the Sun is once every 365 days, 6 hours, and 9 minutes. The Sun is not the exact center of the ellipse but is located closer to one end more than the other of the ellipse. This positioning causes the distance between the Earth and the Sun to change throughout the revolution. A perihelion occurs when Earth is closest to the Sun, while an aphelion occurs when Earth is farthest from Sun. The perihelion between Earth and Sun is approximately 147 million kilometers (91 million miles), and this occurs in the month of January. In July, an aphelion occurs, and Earth is farthest away from the Sun at approximately 152 million kilometers (94 million miles). Although Earth is closest to Sun in January, the minor distance change does not affect the amount of sunlight that reaches Earth. Where you are located on Earth determines the greatest difference of the amount of solar radiation, or sunlight that you receive.

The seasons result from the 23.5-degree tilt of Earth's axis combined with its revolution around the Sun. The Earth remains tilted throughout its orbit around the Sun, and this tilt causes the Sun's radiation to strike the hemispheres at different angles. The hemisphere that is tilted towards the Sun experiences the summer season, while the hemisphere that is tilted away from the Sun experiences the winter season. During the summer season, sunlight, or solar radiation, strikes the hemisphere tilted towards the Sun at approximately a 90-degree angle, while the hemisphere experiencing winter receives sunlight at a much lower angle. These angles are called angles of incidence, and are correlated with a certain concentration of solar energy that is received at a particular location. For example, the locations on the globe experiencing summer and a 90-degree angle of incidence will have a higher concentration of solar energy at that point in time, and the locations on the globe that are in the winter season will have a lower concentration of solar energy. Again, this type of calculation is helpful when considering issues related to plant growth, farming, or solar energy.

Updated Text: The Cycle of Seasons

Have you ever noticed that it gets dark in the winter much earlier in the day compared with the summer? The hemisphere of Earth that is tilted toward the Sun receives more hours of sunlight in each day than the hemisphere that is tilted away from the Sun. This longer period of sunlight is one reason why summer is warmer than winter.

The elliptical nature of the Earth's orbit causes the seasons to occur.

Let's examine the relationship of a planet's axial tilt to its potential seasons. The Earth revolves around, or orbits, the Sun in an elongated, closed-curved path called an ellipse. The rate of revolution around the Sun is once every 365 days, 6 hours, and 9 minutes. The Sun is not the exact center of the ellipse but is located closer to one end more than the other of the ellipse. This positioning causes the distance between the Earth and the Sun to change throughout the revolution. A perihelion occurs when Earth is closest to the Sun, while an aphelion occurs when Earth is farthest from Sun. The perihelion between Earth and Sun is approximately 147 million kilometers (91 million miles), and this occurs in the month of January. In July, an aphelion occurs, and Earth is farthest away from the Sun at approximately 152 million kilometers (94 million miles). Although Earth is closest to Sun in January, the minor distance change does not affect the amount of sunlight that reaches Earth. Where you are located on Earth determines the greatest difference of the amount of solar radiation, or sunlight that you receive.

The seasons result from the 23.5-degree tilt of Earth's axis combined with its revolution around the Sun. The Earth

Proclamation 2024: Report of Editorial Changes (11/08/2023)

remains tilted throughout its orbit around the Sun, and this tilt causes the Sun's radiation to strike the hemispheres at different angles. The hemisphere that is tilted towards the Sun experiences the summer season, while the hemisphere that is tilted away from the Sun experiences the winter season.

The revolution of Earth around the Sun is the central cause of seasonal changes, and the tilt of the Earth determines when each part of our planet will experience these varying seasonal changes. During the summer season, sunlight, or solar radiation, strikes the hemisphere tilted towards the Sun at approximately a 90-degree angle, while the hemisphere experiencing winter receives sunlight at a much lower angle. These angles are called angles of incidence, and are correlated with a certain concentration of solar energy that is received at a particular location.

For example, the locations on the globe experiencing summer and a 90-degree angle of incidence will have a higher concentration of solar energy at that point in time, and the locations on the globe that are in the winter season will have a lower concentration of solar energy. Again, this type of calculation is helpful when considering issues related to plant growth, farming, or solar energy.

Original Text: How can hydroponics be used to help families grow fresh food year round at home?

- Pot materials should be able to be found in the average home.
- Purchased materials should be less than \$35.00, including seeds (if these are provided materials, you still need to provide a cost for the system).
- Growing systems need to fit in an area that is 2 square feet.
- Plants will need to be grown in a window or under a grow light.

Updated Text: How can families grow fresh food year round at home in a limited amount of space?

- Design a solution that allows families to grow crops in a limited amount of space.
- Materials must include: shallow containers, rocks, and a light source.
- Purchased materials should be less than \$35.00, including seeds (if these are provided materials, you still need to provide a cost for the system).
- Growing systems need to fit in an area that is 2 square feet.
- Crops can include spinach, tomatoes, lettuce, peppers, and cucumbers.

How could you apply scientific explanations in your argument? Accept all answers at this time.

Updated Text: In this activity, students will research and critique one of the three hypotheses for the origin of DNA and debate which topic is the best supported.

How can we critique scientific explanations in your arguments?

Accept all answers at this time. But explain to students that a good critique involves the evaluating the logic, evidence, and assumptions behind the explanation. They should also identify the main claim, the supporting arguments, and the empirical data the explanation relies on. The sources of the data, the methods of analysis, and the potential biases or limitations of the explanation can be looked at closely as well. They should compare the explanations with alternative or competing explanations, and assess how well it accounts for the observed phenomena.

Original Text: Using the information gained in this Explore activity, write a scientific explanation in support of cell division being important to repair damage.

When the body undergoes damage, cells divide to replace the cells that died or were damaged beyond repair by the injury to the body.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2600 of 3538

Mitosis is cell division. The body controls when new cells are made for things such as repair of damaged tissues and new growth during the maturation process.

Without cell division, repair would never take place. Damage to the body results in damage to the cells of the body or even cell death. Without cell division, there is no way to replace the cells that were damaged or killed by the injury to the body.

Updated Text: Using the information gained in this Explore activity, write a scientific explanation in support of the cell cycle being important to the growth of organisms.

The cell cycle is important because it can result in the growth of a multicellular organism.

Mitosis is cell division. A single cell separates into two identical daughter cells. The body controls when these new cells are made for things such as new growth during the maturation process or repair of damaged tissues.

Without the cell cycle, growth of a multicellular organism would never take place. Individual cells undergo mitosis to produce two daughter cells. By producing more cells, a multicellular organism can grow larger.

Original Text: 1. How does cell division help an organism develop from two cells (an egg and a sperm) into an organism that is composed of millions or billions of specialized cells?

Without the ability to create more cells through the cell cycle, new organisms would remain as two cells. Mitosis allows the cells to divide and create more cells. Each new cell can divide and become two new cells. Those cells become different organs and tissues through environmental factors or factors within the organism.

Updated Text: 1. How does cell division help an organism grow from two cells (an egg and a sperm) into an organism that is composed of millions or billions of specialized cells?

Without the ability to create more cells through the cell cycle, new organisms would remain as two cells and not grow larger. Mitosis allows the cells to divide and create more cells. Each new cell can divide and become two new cells. Those cells become different organs and tissues through environmental factors or factors within the organism.

Original Text: The TEKS form the foundation for the worktext structure. Chapters 1-9 align to the Science Content Knowledge and Skills Statements. The Scientific and Engineering Practices TEKS are carefully and purposefully integrated throughout the content chapters, and are also supported in a dedicated science practices chapter (chapter 10). TEKS are clearly identifiable to both students and teachers (CG8) via a simple coding system within the Student Edition (CG11). For teachers, additional coding within the Teacher's Edition identifies specific breakouts, allowing teachers to plan to a more granulated level if they wish to do so (CG42)

Original Text: We have included a wide range of practical investigations within Biology for Texas. Practical investigations help teachers meet the required practical component of the program and also provide students with an opportunity to carry out hands-on science exploration, enhancing collaboration, communication, and practical skills while doing so. More information about BIOZONE'S practical activities can be found on CG16.

Updated Text: We have included a wide range of practical investigations within Biology for Texas. Practical investigations help teachers meet the required practical component of the program and also provide students with an opportunity to carry out hands-on science exploration, enhancing collaboration, CG20.

Original Text: The Science Concept TEKS and Scientific and Engineering Practices TEKS are identified in the chapter introduction. For more information, see CG8. Tabs on the first page of an activity identify the TEKS covered within that activity. Red tabs indicate the Science Concept TEKS while blue tabs indicate Scientific and Engineering Practices TEKS. For more information, see CG11. Coding within the margin of a Teacher's Edition identify the TEKS breakout covered within the activity (as shown, right). Red tabs identify the Science Concept TEKS and blue tabs identify the Scientific and Engineering Practices TEKS. Along with the specific breakout code, the tab will also identify if the breakout specifically addresses a narrative (N) or an activity (A) component. Summary tables (CG44-CG51) list all of the TEKS covered throughout Biology for Texas

Updated Text: The Science Concept TEKS and Scientific and Engineering Practices TEKS are identified in the chapter introduction. For more information, see CG12. Tabs on the first page of an activity identify the TEKS covered within that activity. Red tabs indicate the Science Concept TEKS while blue tabs indicate Scientific and Engineering Practices TEKS. For more information, see CG15. Coding within the margin of a Teacher's Edition identify the TEKS breakout covered within the activity (as shown, right). Red tabs identify the Science Concept TEKS and blue tabs identify the Scientific and Engineering Practices TEKS. Along with the specific breakout code, the tab will also identify if the breakout specifically addresses a narrative (N) or an activity (A) component. Summary tables (CG48-CG55) list all of the TEKS covered throughout Biology for Texas.

Original Text: Balancing Equations Have students review the chemical equation shown above Figure 6-24. Write the equation on the board.

Explain to students that this equation shows the overall process of photosynthesis, but it isn't balanced. Balanced chemical equations have the same number of molecules of each element on either side of the reaction. Ask students to identify how the equation should be written so that it is balanced. Guide them to understand that because 6 carbon molecules exist in the product on the right that there should be 6 carbon dioxide molecules in the reactants. Help students reason quantitatively and arrive at the balanced equation,

Updated Text: Balancing Equations Write the following equation on the board:

Explain to students that this equation shows the overall process of photosynthesis, but it isn't balanced. Balanced chemical equations have the same number of molecules of each element on either side of the reaction. Original Text: How does crossing over during meiosis increase the diversity in a population?

- A. DNA is replicated to produce two genetically identical strands.
- B. It allows for the exchange of genetic material between homologous chromosomes.
- C. Alleles are split from one another during division when forming gametes.
- D. It allows the passing of traits to the offspring one at a time.

Updated Text: How does crossing over during meiosis increase the diversity in a population?

- A. DNA is replicated to produce two genetically identical strands.
- B. Homologous chromosomes exchange gene segments, resulting in many new gene combinations.
- C. The alleles are separated from one another during cell division while forming gametes.
- D. It allows the passing of traits to the offspring one at a time.

Original Text: An image shows the nitrogen cycle.

[IMAGE]

Legumes, such as beans and peanuts, have a symbiotic relationship with nitrogen-fixing bacteria. These bacteria convert atmospheric nitrogen into a form of nitrogen that the plant can use. In return, the plant provides the bacteria with food. Excess organic nitrogen is left in the soil.

What would be the consequences of the loss of these bacteria?

Updated Text: An image shows the nitrogen cycle.

Location: Unit 4 > Concept 1 > Lesson 6 > Lesson Planning > FACILITATING THE LEARNING

Original Text: Explain that when rubisco fixes oxygen, plants have to undergo photorespiration to undo the reaction. Engage the students in a discussion about the different processes that plants use compared to the stages of C3 and C4 photosynthesis. Briefly describe the differences in biomolecules and ATP production between C3 and C4 plants, including the role of PEP carboxylase in fixing carbon dioxide into 4-carbon oxaloacetate, and how the C4 pathway allows for the concentration of CO₂ around rubisco.

Updated Text: Explain that when RuBisCO fixes oxygen, plants have to undergo photorespiration to undo the reaction. Location: Unit 4 > Concept 3 > EXTENSION > STEM Project Starter: Conditional Plant Growth > Lesson Planning > Setting the Purpose

Original Text: Time: 5 minutes

Review with students the conditions that seeds need to germinate. Introduce the project to students.

Lead a class discussion by asking:

ASK What would be some conditions that you would need to consider when designing your terrarium-style greenhouse?

Sample Student Response: the types of substrate that would be best for the germinating seeds, as well as growing roots amount of space the container provides as compared to the needs of the plants
the amount of time it takes for the seeds to germinate
moisture, light, and space needs of the plants

Updated Text: Time: 5 minutes

Explain to students that they will be working in teams to design a terrarium-style greenhouse where they will monitor seed germination and plant growth. Provide students with context by explaining the purpose of this activity is to investigate the factors that contribute to successful plant growth. Have students think pair share about such factors and then probe for prior knowledge.

ASK What factors contribute to successful plant growth?

Sample student response: soil quality, water availability, light exposure.

Explain to students that the terrarium provides optimal growth conditions to monitor plant progress over time.

Original Text: Have students read the CIT. When students have completed the reading, instruct students to research three runoff reduction methods and explain how these methods relate to the nitrogen and/or phosphorous cycles.

Updated Text: Have students read the lesson text. To support students in carrying out their project, consider providing a list of credible scientific sources for them to research, such as government or institutional websites. If time allows, as an additional activity encourage students to conduct field research by visiting local farms or agricultural extension sites if possible. Students can work in pairs or small groups to determine the effectiveness of different runoff reduction methods. Students can present their findings using visual aids such as charts, graphs, or videos. When students have completed their research, instruct students to research three runoff reduction methods and explain how these methods relate to the nitrogen and/or phosphorous cycles.

Location: Unit 5 > Concept 1 > Extension > STEM Project Starter: Nondisjunction Dysfunction > Lesson Planning > CHECK FOR UNDERSTANDING

Original Text: To check for understanding of the general concept, ask the students to answer the question.

Updated Text: To support students in responding to these items, provide them with clear explanations of karyotypes and non-disjunction and their significance in genetic variation. Encourage students to practice identifying chromosome abnormalities and to explore the impact of non-disjunction on human health. Additionally, provide resources such as case studies or research articles to help students understand how these concepts apply to real-world scenarios.

Component: *Science Techbook for Texas by Discovery Education: Biology*

ISBN: 9781616291518

Current Page Number(s): <https://app.discoveryeducation.com/learn/player/14f34b82-501f-40de-9296-80017bdc8fe7>

Location: Unit 5 > Concept 1 > Extension > STEM Project Starter: Nondisjunction Dysfunction > Lesson Planning > SETTING THE PURPOSE

Original Text: Ask students to recall that there are some disorders that are passed from parents to offspring by chromosomal abnormalities. For example, non-disjunction is the failure of sister chromatids to separate normally during cell division. This results in an abnormal number of chromosomes, which is called aneuploidy. Trisomy is one type of aneuploidy, and it is one of the primary causes of Down syndrome. Ask: How many pairs of human chromosomes are usually present?

Ask students to read through the text. Students should compare and contrast the different syndromes that occur as a result of having too many or too few chromosomes. Students should determine what the effects are of each of the chromosomal abnormalities.

ASK: Ask students to read through the text. Students should compare and contrast the different syndromes that occur as a result of having too many or too few chromosomes. Students should determine what the effects are of each of the chromosomal abnormalities. Sample student response: Klinefelter Syndrome is a sex-linked disorder found in males. These people have XXY chromosomes and may have some female characteristics.

Updated Text: Ask students to recall that there are some disorders that are passed from parents to offspring by chromosomal abnormalities. For example, non-disjunction is the failure of sister chromatids to separate normally during cell division. This results in an abnormal number of chromosomes, which is called aneuploidy. Trisomy is one type of aneuploidy, and it is one of the primary causes of Down syndrome. Ask: How many pairs of human chromosomes are usually present?

Original Text: A new branch of biology, bioethics, has evolved to deal with questions such as these. Bioethicists investigate the pros and cons of genetic engineering. They consider new developments and weigh their benefits against negative impacts. How do you feel about these possibilities? Do you think it is ethical to artificially change an organism's traits? What about "designer babies" with traits chosen by the parents? Is this different than using genetic engineering to cure diseases?

Original Text: Designer Babies? Tell students: One of the most controversial uses of genetic engineering is the idea of changing the genes in a human baby before they are born. Direct them to read the passage Designer Babies?

When students finish reading the passage,

ASK: What do you think about possible designer babies? Where would you draw the line about what is acceptable?

Student Sample Response: Students may have thoughtful responses that attempt to balance concerns like improving health or allowing families with hereditary diseases to have children versus more superficial desires for children who look a certain way. Solicit thoughts, but do not feel obliged to have all the answers or pass judgment. You might wrap up by saying, It is a really complex bioethics problem! People will have to figure it out during the next few decades.

Updated Text: Human Traits Tell students: One of the most controversial uses of genetic engineering is the idea of changing the genes in a human baby before they are born. Direct them to read the passage Human Traits.

When students finish reading the passage,

ASK: What do you think about the possibility of selecting traits in human offspring? Where would you draw the line about what is acceptable? Student Sample Response: Students may have thoughtful responses that attempt to balance concerns like improving health or allowing families with hereditary diseases to have children versus more superficial desires for children who look a certain way. Solicit thoughts, but do not feel obliged to have all the answers or pass judgment. You might wrap up by saying, It is a really complex bioethics problem! Original Text: Therapeutic cloning uses a similar method, but the goal is different. The resulting embryonic cells (that is, pluripotent stem cells) are treated to develop not into whole organisms, but into particular tissues or organs. The hope is that the stem cells will replace harmful or damaged cells for people with certain diseases, such as Alzheimer's and cancer.

Original Text: This challenge requires you to do online research.

Updated Text: Engineers define and solve problems. They develop and use prototype models as helpful tools for representing ideas and explanations in order to develop a solution to a problem. Engineers must also clearly and persuasively communicate that their solution will solve the problem being addressed. Steps in the engineering process include defining the problem, doing background research, understanding or specifying the requirements, brainstorming solutions, and then choosing and developing the best solution. Only then can you build a prototype, test it, redesign if necessary, and then communicate results.

This challenge requires you to do online research to make a prototype eBandage.

Updated Text: The scientific idea of how cell membranes work revolves around the understanding that cells are enclosed by a thin barrier called the cell membrane or plasma membrane. The cell membrane plays a vital role in maintaining the integrity and functionality of cells. You will also be using digital tools to organize and display your qualitative data in the form of a chart.

Visual representations aid in identifying patterns, trends, and relationships within the data. Qualitative data can be transformed into meaningful and easily understandable visual formats, such as a chart such as a scatter plot. A scatter plot displays a relationship between two sets of data. This plot will show the relationship between relative color intensity and temperature.

Updated Text: Models provide a visual representation of complex concepts like photosynthesis and respiration, making them easier to understand.

Models simplify complex systems or processes, breaking them down into manageable components, and highlighting key relationships or elements. By simplifying the processes and representing them in a tangible form, models help you grasp the key concepts and principles underlying these biological processes.

Original Text: Today, more doors are open, and women and people of color increasingly push the boundaries of scientific knowledge. For example, Dr. Kizzmekia Corbett, shown in Figure 11, led a team at the National Institutes of Health (NIH) that helped develop the SARS-CoV-2 vaccine. In addition to her laboratory work, Dr. Corbett leads community outreach, working to explain the safety and efficacy of vaccines.

Other women leading cutting-edge research include Dr. Ting Xu at the University of California at Berkeley and Dr. Rona Chandrawati at the University of South Wales, both of whom research nanotechnology. Dr. Xu's work with energy storage systems and printable solar cells has the potential to revolutionize renewable energy. Dr. Chandrawati's work focuses on

smart labels that detect when food becomes contaminated, a technology that would greatly increase the safety of the world's food supply.

Original Text: Coral polyps use calcium carbonate to build their hard, protective structures. They create coral reefs that other species use as a habitat. Like all ecosystems, coral reefs are sensitive to changes in the environment. As a result, they are not immune to the impact of climate change, including increases in atmospheric carbon dioxide (CO₂). As seawater absorbs more CO₂, the pH of the water decreases, making the water more acidic. This reduces the amount of calcium carbonate in the water and slows the growth of coral skeletons, along with the reef itself. Ultimately, this impacts other organisms that inhabit the reef. Damage to coral reefs also occurs when climate change alters ocean circulation, intensifying storms. Climate change increases water temperature as well, which also harms reefs, as shown in Figure 30.

Updated Text: Coral polyps use calcium carbonate to build their hard, protective structures. They create coral reefs that other species use as a habitat. Like all ecosystems, coral reefs are sensitive to changes in the environment. Climate change increases water temperature, which harms reefs, as shown in Figure 30. Climate change also increases in atmospheric carbon dioxide (CO₂). As seawater absorbs more CO₂, the pH of the water decreases, making the water more acidic. This reduces the amount of calcium carbonate in the water and slows the growth of coral skeletons, along with the reef itself. Ultimately, this impacts other organisms that inhabit the reef. Damage to coral reefs also occurs when climate change alters ocean circulation, intensifying storms.

Original Text: Remember that living organisms are made of cells. Inside cells are organelles, each of which performs specific functions, such as synthesizing proteins. Cells themselves perform different functions. For example, cells in muscles contract in order to move the muscle. Certain cells in the stomach produce proteins and acids to digest food. All of these cellular activities require energy, which is the ability to do work.

Therefore, even when you are sleeping, the chemical reactions and other processes that happen in cells are going on.

Even when you might not think that

you are using any energy you are. In other words, cells require energy

continuously. Bioenergetics is the study of how cells obtain, store, and use energy. You'll learn more about bioenergetics in this lesson.

Location: Climate Impacts on Plant Reproduction header, 2nd paragraph

Original Text: Some plants require low temperatures to go into dormancy and, in some places, those temperatures aren't being reached in winter. Instead of going dormant, seeds germinate, and often are killed off by frost. Some climate impact changes in plant reproduction are second hand. Many species of animals, including monkeys, birds, and bats are essential for seed dispersal, such as the macaque in Figure 22. A decrease in these populations makes their companion plants' seed dispersal mechanisms less effective. Climate change affects almost every stage of plant reproduction.

This formative assessment worksheet explores the question: “How do scientists do their work?” Uncover student preconceptions about the process of science. Common preconceptions include that scientific investigations follow a strict procedure, scientific knowledge is complete, all scientists work in labs, and scientists usually work alone.

Original Text: Beginning

Write the words living things on the board. Show pictures of people, plants, animals, organisms, cells, bacteria. For each category of living things say: This is/

These are living things. (point to the words living things on the board) Contrast with a few pictures of non-living things and pointing to things in the classroom (table, car, house, etc.) and, shaking your head, say: These are non-living things. Confirm understanding by asking students to point to things that are living and things that are non-living.

Intermediate

Write the words living things on the board. Show pictures of people, plants, animals, organisms, cells, bacteria. For each category of living things say: This is/

These are living things (point to the words living things on the board). Contrast with a few pictures of non-living things and pointing to things in the classroom (table, car, house, etc.) and say: These are non-living things. Confirm understanding by asking students to distinguish between living and non-living things. Have students use sentence stem: A [plant] is a _____. (living thing) A [table] is not a _____ (living thing) Point to the text book and the word biology and say: Biology is the study of living things.

Advanced/Advanced High

Ensure comprehension of the term living things by asking students to give examples of living things. (people, plants, animals, organisms, cells, bacteria) Be sure they use the term living things as they give their examples. Explain how Biology is the study of all living things.

Write the word characteristic on the board. Use gestures and sketches to get the meaning across of the word and ask students to repeat the word after you. Say: A characteristic is something about us. Some characteristics of me are, I have

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2750 of 3538

brown hair. I have brown eyes. I am tall. Check understanding of the word by asking students to point to their own characteristics and point out characteristics specific to animals in pictures. For example, students point to the trunk of an elephant. You say: Yes, the trunk is a characteristic of an elephant. Continue by showing other species and pointing out the characteristics.

Intermediate

Write the word characteristic on the board. Have students find the word in their text. Use gestures and sketches to get the meaning across of the word and ask students to repeat the word after you. Say: A characteristic is something about people, animals or things. Some characteristics of me are, I have brown hair. I have brown eyes. I am tall. A characteristic of a giraffe is a long neck. Check understanding of the word by asking students to tell about characteristics specific to animals using a sentence stem. A _____ is a characteristic of a _____.

Advanced/Advanced High

Have students find the word characteristic in their text. Ask students to repeat the word after you. Elicit a definition in their own words and some examples. Check understanding of the word by asking students to talk about characteristics specific to certain species.

Updated Text: Beginning

Write the word characteristic on the board. Use gestures and sketches to explain the meaning of the word, and ask students to repeat the word after you. Say:

Current Page Number(s): 158

Location: Answer Key, 1st Page 116 Question/Answer

Original Text: Ask Yourself Describe how density-dependent factors can be influenced by climate change. Sample answer: Disease is a density-dependent factor that can be influenced by climate change because organisms, like bats with white-nose syndrome, are using energy to fight off the fungus and do not have the energy to reproduce.

Updated Text: Ask Yourself Explain why white-nose syndrome is a density-dependent factor. When the population density of bats is high, the fungus spreads quickly between individuals. When the population density of bats is low, the fungus spreads more slowly.

ISBN: 9781265765026

Current Page Number(s): 888

Location: Explain, top of page, Summary Writing

Original Text: Bacteria have peptidoglycan; archaea do not. Peptidoglycan provides strength for the cell wall and also gives shape to the bacteria. Ribosomal proteins are different in bacteria and archaea. Ribosomes consist of RNA and proteins. Archaea genes have introns, while bacterial genes lack introns. Introns are noncoding nucleic acid sequences. Archaea are the only organisms known to survive in extreme environments. These environments include hot springs, thermal vents, areas with a high salt concentration, and highly acidic environments.

Updated Text: Bacteria have peptidoglycan; archaea do not. Peptidoglycan provides strength for the cell wall and also gives shape to the bacteria. Ribosomal proteins are different in bacteria and archaea. Ribosomes consist of RNA and proteins. Original Text: Clarify a Preconception | 5 minutes

Ask: What do you think of when you hear the word seaweed? Some students might think of plants found along the seashore. This is partly true. Seaweeds are found in the sea, but they are actually protists. They are the multicellular species of algae that live in the world's oceans. Species include kelp, sea lettuce, and bladder wracks. Seaweeds dominate the rocky intertidal and subtidal areas of most oceans and provide food and shelter for other marine organisms.

Quick Lab

Homeostasis and Blood Glucose | Labs | 20 minutes

Students will perform a role play designed to illustrate what happens during the disruption of homeostasis in Type 1

diabetes. The role play is designed to facilitate students' understanding of the role of the pancreas, glucose, insulin, glucagon, and muscles in glucose homeostasis.

Updated Text: [red lab box]

Quick Lab: Descriptive

Model the Endocrine System | Labs | 25 minutes

Students will create a model to show how the endocrine system uses hormones to maintain homeostasis.

Component: McGraw Hill Texas Biology Teacher Edition

ISBN: 9781265765026

Current Page Number(s): 1095

Location: ELPS Support

Original Text: Beginning

Write the word homeostasis and model the pronunciation. Draw a stick figure on the board with a thermometer coming out of its mouth. Write 98.6°F/37°C on the thermometer. Say: This person has a normal temperature. Draw a hot sun above the figure and sweat coming off the figure's face. Gesturing to support comprehension, say: It's very hot outside, but this person's temperature doesn't change. Continue with different types of weather. Then, using gestures and other such visuals to support comprehension, say: This is an example of homeostasis. This person's temperature stays the same even when the outside temperature changes.

Intermediate

Write the word homeostasis and model the pronunciation. Draw a stick figure on the board with a thermometer coming out of its mouth. Write 98.6°F/37°C on the thermometer. Say: This person has a normal temperature. Draw a hot sun above the figure and sweat coming off the figure's face. Say: It's very hot outside, but this person's temperature doesn't change. This is an example of homeostasis. This person's temperature stays the same even when the outside temperature changes. Continue with different types of weather. Then ask: What is this an example of?

Advanced/Advanced High

Write the word homeostasis and model the pronunciation. Ask: What is the average temperature of the human body? When it's very hot outside, what happens to your temperature? What happens to it when it's very cold outside? Say: This is an example of homeostasis. Then ask a volunteer to give a definition of homeostasis based on what they've just learned. If students have trouble, have a volunteer find the definition in the first paragraph of the reading and share it.

Original Text: N/A (Original does not include TEKS and SEPs that are covered in each lesson.)

Updated Text: For all 52 Experiences (lessons), the TEKS and SEPs taught in that lesson have been added to the table, after each lesson title. No content was removed from the original.

Example for Investigation 1 Experience 1: TEKS 5A; SEP 2A, 2B

Also added new head "TEKS-Aligned Scope & Sequence"

Original Text: (Original text did not mention drinking water as a benefit.)

Without floods, farmland may deteriorate.

Updated Text: Dams have both costs and benefits for communities.

Reservoirs provide reliable sources of drinking water.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Location: Eukaryotic Chromosome art

Link to Updated Content:

[View Updated Content](#)

Original Text: The Eukaryotic Chromosome art is illustrated from the chromosome on the left to the DNA helix on the right with text captions from left to right as 1, 2, 3, 4. On the art, the numbers are identified as 4, 3, 2, 1. This is confusing as is because the numbers do not align.

Updated Text: The Eukaryotic Chromosome art is updated so that the DNA helix is on the left and the chromosome is on the right. This allows the text blocks and numbers within art to line up from left to right 1, 2, 3, 4.
