Location: side column, Take it Localmain column last paragraph

Original Text: Like other states, Texas requires that students be vaccinated in order to attend school (Texas Administrative Code [TAC], Title 25 Health Services, §§97.61-97.72). Required vaccinations for K–12 include those for diphtheria, tetanus, pertussis, polio, measles, mumps, rubella, hepatitis B, varicella, chicken pox, and hepatitis A. Serologic evidence of infection or serologic confirmation of immunity to measles, mumps, rubella, hepatitis B, hepatitis A, or varicella is acceptable in place of vaccine.

Make sure that students are aware of infectious diseases in current events, particularly in the United States and in their local area. In 2022, there was a worldwide outbreak of mpox, formerly known as human monkeypox, and avian flu decimated wild birds and poultry flocks in Europe and the United States. Ask In the middle of the 20th century, even scientists believed that infectious diseases would soon be a thing of the past. Why, as Anthony Fauci wrote in December 2022, do we now know that “when it comes to emerging infectious diseases, it’s never over”? (Pathogens like flu and COVID-19 change; bacteria become antibiotic-resistant; people do not always act in ways that promote public health or cooperate with government health policies; humans encroach on wildlife habitats, increasing the chances of zoonotic diseases; climate change increases the range of certain pathogens and vectors.)

Updated Text: Like other states, Texas requires that students be vaccinated in order to attend school. Required vaccinations for K–12 include those for diphtheria, tetanus, pertussis, polio, measles, mumps, rubella, hepatitis B, varicella, chicken pox, and hepatitis A.

Make sure that students are aware of infectious diseases in current events, particularly in the United States and in their local area. In 2022, there was a worldwide outbreak of mpox, formerly known as human monkeypox, and avian flu decimated wild birds and poultry flocks in Europe and the United States. Ask In the middle of the 20th century, even scientists believed that infectious diseases would soon be a thing of the past. Why do you think that when it comes to emerging infectious diseases, it’s never over? (Pathogens like flu and COVID-19 change; bacteria become antibiotic-resistant; people do not always act in ways that promote public health or cooperate with government health policies; humans encroach on wildlife habitats, increasing the chances of zoonotic diseases; climate change increases the range of certain pathogens and vectors.)

Location: (1) flow chart(2) image caption

Original Text: (1) [Flow chart with 5 boxes containing text. The first box says "Observations" and has an arrow pointing to the second box, which says "Hypothesis: A Hypothesis may be revised based on experimental data." An arrow points to the next box, which says "Experiments: An experiment can lead to observations that support or disprove a hypothesis." One arrow points from this box back to the box labeled Hypothesis, one arrow points down vertically to a box that says "Scientific Law: A scientific law summarizes the results of many observations and experiments" and one arrow points to the right to a box that says "Scientific theory: A theory is tested by more experiments and modified if necessary." Another arrows points back to the box labeled Experiments.]

(2) The flowchart shows the relationships between a scientific hypothesis, theory, and law. As shown by the arrows, the steps can occur in a variety of orders.

Updated Text: (1) [Venn diagram that compares theories and laws]

Scientific Theory

Explains why or how a broad class of related phenomena occur

Example: Some diseases are caused by the invasion of the body by microorganisms. (Germ Theory)

Scientific Law

Describes what happens under certain conditions, often using math

Example: An object in motion stays in motion unless acted upon by an outside force. (Newton's first law of motion)

[middle shared section]

- Can start as hypotheses that explain or describe
- Backed by evidence
- Can be used to make predictions
- Can be revised

(2) The diagram shows how you can distinguish among scientific hypotheses, theories, and laws. Theories and laws have different purposes, and we often need both of them to understand the whole picture.

Location: p. 2, caption for atomic model p. 3, callout on right side of image

Original Text: [p.2] This is a conceptual model of an atom. It shows a dense nucleus composed of protons and neutrons, with electrons moving around it. Atoms are too small to observe directly, so this model shows the parts of an atom and is based on scientific observations of experiments on atoms.

[p. 3] The shapes of the orbits are not represented accurately. In reality, they are shaped like ovals, not circles.

Updated Text: [p. 2] This is an early conceptual model of an atom. It shows a nucleus composed of protons and neutrons, with electrons moving around it. Although not completely accurate, this model is based on early observations in experiments on atoms.

[p. 3] The shapes of the orbits are not represented accurately. In reality, they are elliptical, not circular.

Original Text: Today, more doors are open, and women and people of color increasingly push the boundaries of scientific knowledge. For example, Dr. Kizzmekia Corbett, shown in **Figure 11**, led a team at the National Institutes of Health (NIH) that helped develop the SARS-CoV-2 vaccine. In addition to her laboratory work, Dr. Corbett leads community outreach, working to explain the safety and efficacy of vaccines. Other women leading cutting-edge research include Dr. Ting Xu at the University of California at Berkley and Dr. Rona Chandrawati at the University of South Wales, both of whom research nanotechnology. Dr. Xu’s work with energy storage systems and printable solar cells has the potential to revolutionize renewable energy. Dr. Chandrawati’s work focuses on smart labels that detect when food becomes contaminated, a technology that would greatly increase the safety of the world’s food supply.

Original Text: Chemical reactions are essential to our daily lives; however, the products or by-products of some reactions can have negative effects. We know that Earth's climate is changing and as a result sea levels are rising, and storms and wildfires are becoming more frequent. The main cause of climate change is an increase in greenhouse gases in the atmosphere.

Greenhouse gases, which include carbon dioxide, methane, nitrous oxide, and even water vapor, allow energy from sunlight into Earth's atmosphere, but prevent energy from leaving Earth's atmosphere back into space.

Gas stoves, like the one in Figure 1, burn carbon-based fuels, such as natural gas. Combustion releases heat, which is useful for cooking, but also produces carbon dioxide and water vapor. Other activities that produce greenhouse gases include driving, generating electricity, heating homes, and raising livestock.

Updated Text: Chemical reactions are essential to our daily lives; however, the products or by-products of some reactions can have negative effects. Gas stoves, like the one in Figure 1, burn carbon-based fuels, such as natural gas. Combustion

Proclamation 2024: Report of Editorial Changes (11/08/2023)

releases heat, which is useful for cooking, but also produces carbon dioxide and water vapor. Other activities that produce greenhouse gases include driving, generating electricity, heating homes, and raising livestock.

We know that Earth's climate is changing and as a result sea levels are rising, and storms and wildfires are becoming more frequent. The main cause of climate change is an increase in greenhouse gases in the atmosphere. Greenhouse gases, which include carbon dioxide, methane, nitrous oxide, and even water vapor, allow energy from sunlight into Earth's atmosphere, but prevent energy from leaving Earth's atmosphere back into space. Greenhouse gases have many natural sources, but human activities are greatly increasing their concentrations in the atmosphere.

Component: McGraw Hill Texas Chemistry Student Edition

ISBN: 9780077006808

Current Page Number(s): 242

Location: page 242, Driving Question paragraphs

Original Text: The flowchart shown in Figure 6, on the next page, can help you to visualize the steps for balancing chemical equations. Let's try using these steps to balance an equation for a reaction that produces greenhouse gases. As mentioned at the beginning of the lesson, some gas stoves burn natural gas. The principal component of natural gas is methane, CH₄.

Updated Text: As mentioned at the beginning of the lesson, some gas stoves burn natural gas. The principal component of natural gas is methane, CH₄. Like carbon dioxide, methane is a greenhouse gas. Compared to carbon dioxide, methane is roughly twenty-eight times more effective at trapping infrared radiation and causing warming over a 100-year time span.

Location: Page 355 narrative

Original Text: Unfortunately, there is no single set of conditions universally agreed on for STP. However, two definitions stand out as the most common that you will encounter as you study chemistry:

- The International Union of Pure and Applied Chemistry (IUPAC) defines standard temperature and pressure as a temperature of 0.00°C and a pressure of 100 kPa. Using these values of temperature and pressure, the molar volume of a gas is 22.7 L/mol.
- The National Institute of Standards and Technology (NIST) defines standard temperature and pressure as a temperature of 0.00°C and a pressure of 1 atm. Using these values of temperature and pressure, the molar volume of a gas is 22.4 L/mol.

Notice that both definitions use the same temperature. However, the pressures are slightly different. One atmosphere of pressure equals 101.325 kPa, slightly higher than the 100 kPa of pressure used in the IUPAC definition. This is what accounts for the slightly smaller molar volume in the NIST definition:

Updated Text: Before 1982, IUPAC defined STP as 0.00°C and 1 atm (101.3 kPa). Since 1982, IUPAC has defined STP as a temperature of 0.00°C and a pressure of 100 kPa.

What do these different definitions of STP mean for the molar volume? Using the pre-1982 values (0.00°C and 1 atm), the molar volume of a gas is 22.4 L/mol. Using the current IUPAC definition (0.00°C and 100 kPa), the molar volume of a gas is 22.7 L/mol. It's important to understand that neither of these values for the molar volume of a gas is right or wrong. It simply depends on which conditions are specified for STP.

Notice that the current and former definitions of STP use the same temperature. However, the pressures are slightly different. The slightly higher pressure in the older definition accounts for the slightly smaller molar volume:

Current Page Number(s): 5

Location: Chapter Close

Original Text: ChemLAB Use Density to Date a Coin | Labs | 45 minutes

Students will determine and compare the density of pennies.

Updated Text: ChemLAB: Determine Density | Labs | 50 minutes

Measure the mass and volume of an object, then calculate the density of the object.

Component: McGraw Hill Texas Chemistry Teacher Edition

ISBN: 9781265762179

Current Page Number(s): 14

Location: Topic: Types of Scientific Investigations

Original Text: 30 minutes

Students will practice proper laboratory etiquette.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2840 of 3538

Updated Text: 50 minutes

Students will measure mass and volume of substances and separate components of a mixture through filtration.

Component: McGraw Hill Texas Chemistry Teacher Edition

ISBN: 9781265762179

Current Page Number(s): 14

Location: Topic: Types of Scientific Investigations

Original Text: N/A

Updated Text: [lab icon] Virtual Lab: Chemistry Virtual Labs Tutorial | Labs | 30 minutes

Students will complete a tutorial of the Virtual Labs platform.

Component: McGraw Hill Texas Chemistry Teacher Edition

ISBN: 9781265762179

Current Page Number(s): 22

Location: Explain, Derived Units

Original Text: Quick Investigation: Determine Density 15 min

Updated Text: Effective Use of a Bunsen Burner 50 min

Ask students to draw the Lewis structure for the molecule H₂S.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2862 of 3538

[molecule art]

REINFORCE Draw the structural formulas for C₂H₆, C₂H₄, and C₂H₂. Ask students to identify all sigma and pi bonds. Using a table of bond energies and bond lengths, have students compare the bond lengths and bond energies of C—C, C=C, and C≡C. As the number of bonds between two atoms increases, the bond length shortens and becomes stronger.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2889 of 3538

Location: (middle of page)

Original Text: Ask Yourself Why do some substances become more soluble with increasing temperature?
Increasing the temperature of a solvent increases the kinetic energy of its particles, resulting in more-frequent collisions and collisions with greater energy than those that occur at lower temperatures. The result is more solvation occurring with increasing temperature.

Updated Text: Ask Yourself What is a supersaturated solution? A supersaturated solution is a solution that, at a certain temperature, contains more dissolved solute than a saturated solution at that same temperature.

Original Text: When an acid and a base react in a neutralization reaction, the products are a salt and water.

Updated Text: When an acid and a base react in a neutralization reaction, the products are a salt and water. A titration is a neutralization reaction that can be used to determine the molarity of an acidic or basic solution of unknown concentration. An indicator that changes colors according to pH can be used to monitor the status of the titration. The figure at right shows how the indicator bromothymol blue changes from bright yellow in an acidic solution to greenish in a neutral solution to dark blue in a basic solution.

Original Text: Quick Investigation
Observe a Redox Reaction | Labs | 25 minutes
Students will observe a redox reaction.

Updated Text: Quick Lab
Observe a Redox Reaction | Labs | 25 minutes
Students will observe a chemical reaction that can remove tarnish from silver.

Component: McGraw Hill Texas Chemistry Teacher Edition

ISBN: 9781265762179

Current Page Number(s): 862

Location: (middle of page)

Original Text: Small-Scale Lab
Reduction of Manganese | Labs | 50 minutes
Students will observe the reduction of manganese to determine the oxidizing agent.
Laboratory
Electron-Losing Tendencies of Metals | Labs | 50 minutes
Students will determine the tendency of metals to lose electrons in redox reactions.

Updated Text: Small-Scale Lab
Reduction of Manganese | Labs | 50 minutes
Students will calculate a value for the molarity of a KMnO_4 solution using stoichiometry and volume data; write and balance oxidation-reduction equations.
Laboratory
Electron-Losing Tendencies of Metals | Labs | 50 minutes
Students will predict the relative strengths of metals as reducing agents, and conduct an experiment to test the prediction.

Updated Text: Compare and contrast the structure of the sodium atom (Na) with that of the sodium ion (Na⁺) in terms of the locations and numbers of protons, neutrons, and electrons. Sodium has an atomic number of 11 and an atomic mass of 23 u.

A sodium atom with an atomic mass of 23 u has 11 protons and 12 neutrons in the nucleus. It has 11 electrons in its electron cloud. When this sodium atom forms an Na⁺ ion, it still has 11 protons and 12 neutrons in the nucleus. The sodium ion has 10 electrons in its electron cloud.

Original Text: N/A

Updated Text: The most common isotope of oxygen is O-16. How many protons and neutrons are in the nucleus of an O-16 atom? How many electrons are in the electron cloud? If an atom of O-16 forms a 2- ion, how many protons and neutrons are in the nucleus of this ion? How many electrons are in the electron cloud of an O²⁻ ion?

An oxygen-16 atom has 8 protons and 8 neutrons in its nucleus. It also has 8 electrons in its electron cloud. When an atom of this isotope forms a 2- ion, it gains two electrons. Therefore, the ion has 10 electrons in its electron cloud. The nucleus of the ion still has 8 protons and 8 neutrons.

Field Investigation Use the field version of the lab, which involves visiting a university research lab. Students will observe real-world examples of material properties, resulting from forces within the material, and discover how these concepts connect to future careers. Prior to the visit, discuss appropriate safety practices and equipment for this field investigation. For example, students should wear pants and close-toed shoes, bring safety goggles and wear them when in any lab, and use the buddy system while onsite. Additionally, have students prepare questions for the researchers. Encourage them to keep the majority of the questions focused on material properties and STEM careers.

The first box says "Observations" and has an arrow pointing to the second box, which says "Hypothesis: A Hypothesis may be revised based on experimental data." An arrow points to the next box, which says "Experiments: An experiment can lead to observations that support or disprove a hypothesis." One arrow points from this box back to the box labeled Hypothesis, one arrow points down vertically to a box that says "Scientific Law: A scientific law summarizes the results of many observations and experiments" and one arrow points to the right to a box that says "Scientific theory: A theory is tested by more experiments and modified if necessary." Another arrows points back to the box labeled Experiments.]

(2) The flowchart shows the relationships between a scientific hypothesis, theory, and law. As shown by the arrows, the steps can occur in a variety of orders.

Updated Text: (1) [Venn diagram that compares theories and laws]

Scientific Theory

Explains why or how a broad class of related phenomena occur

Example: Some diseases are caused by the invasion of the body by microorganisms. (Germ Theory)

Scientific Law

Describes what happens under certain conditions, often using math

Example: An object in motion stays in motion unless acted upon by an outside force. (Newton's first law of motion)

[middle shared section]

- Can start as hypotheses that explain or describe
- Backed by evidence
- Can be used to make predictions
- Can be revised

(2) The diagram shows how you can distinguish among scientific hypotheses, theories, and laws. Theories and laws have different purposes, and we often need both of them to understand the whole picture.

Page 2942 of 3538

Updated Text: Teachers are encouraged to include caregivers in as much of the education process as possible. Hold regular meetings and encourage individuals to partake; ensure they know their opinions and voices are valued. For caregivers that may not be able to attend meetings, use another form of communication so their voices are also included. Acknowledge and show gratitude for the time caregivers give to help the students. When schools, and teachers, communicate well with caregivers, everyone involved benefits!

CHAPTER 5 PRE-TEST

What is the fossil record? (The fossilized remains of past life forms preserved in sedimentary rock.)

SECTION 5.2 ASSESSMENT

How do depositional environments make fossilization more likely to occur?(Depositional environments are areas where sediment is deposited. They allow for quick burial in a low oxygen environment, which minimizes decay and destruction of the remains by scavengers or weathering.)

CHAPTER 5 CHAPTER TEST

21. How do sedimentation, fossilization, and speciation affect the degree of completeness of the fossil record? (Environments where sedimentation occurs provide the rapid burial and low oxygen conditions that must exist for fossilization to occur. The level of fossilization differs between species. The existence of hard body parts and living in or near a suitable depositional environment favors fossilization. The change in some species is well represented in the fossil record while the evidence of others is incomplete or nonexistent.)

CHAPTER 5 POST TEST

A paleontologist is interested in the evolution of an ancient butterfly. What are the chances the paleontologist will be able

Updated Text: [dext deleted]

Location: top of lefthand column

Original Text: to construct a complete fossil record of the changes such an organism has gone through over time? Why? (It is unlikely that a paleontologist would be able to construct a complete fossil record of the evolution of a butterfly. Most butterflies do not live in depositional environment where they would be buried quickly. In addition, their bodies are soft and more likely to decay before fossilization could take place. Even if a few butterflies were fossilized, it is unlikely that every speciation event would be preserved in the fossil record. At best, the paleontologist could expect to find an incomplete fossil record with many gaps if, indeed, a fossil record exists at all.)

Updated Text: checkpoint Fossilization requires very specific conditions and generally only occurs in depositional environments, which excludes many organisms. Also, most organisms are soft-bodied, and soft-bodied organisms are rarely fossilized.

Original Text: ON ASSIGNMENT

The On Assignment photograph was published in April 2020 in an Earth Day 50th Anniversary Special National Geographic Issue. The article titled "The road to 2070" by Craig Welch, photographs by David Guttenfelder. Texas has a large capacity for windpower. The wind farm pictured was constructed in the Permian Basin where most of the state's oil and gas deposits reside. Despite the access to oil and gas deposits in the area, this structure will provide renewable electricity for much longer than the nonrenewable resources will be available. The winds will still blow when the oil is long gone! Use Figure 6-23 to think about the materials that are needed to create wind turbines. Use these ideas to discuss the benefits and drawbacks of wind power.

Original Text: LAND AND SEA

Have the expert group for this topic read and discuss the sections on ecosystem impacts, sea-level rise and warming, and ocean acidification, using the following focus questions as a guide. Ask:

- What are the major ecosystem effects likely to be brought on by climate change? (Changes in soil moisture will lead to wildfires that will transform forests into savannas. Disease organisms and parasites will become more common. Species unable to adapt to warmer temperatures may go extinct, but other species may increase in numbers.)
- What two factors cause a rise in sea levels with increases in average global temperatures? (When water warms, it expands, and this will increase sea levels. Warmer temperatures also lead to melting of polar ice sheets, which will add more water to the oceans.)
- What is the cause of ocean acidification? (As carbon dioxide concentrations increase in the atmosphere, more dissolves in the ocean. The dissolved carbon dioxide produces carbonic acid, which makes the water acidic.)

Link to Updated Content:

[View Updated Content](#)

Original Text: **Chemistry's Impact on Air Quality**

Smog is a famous example of chemical reactions impacting air quality. Produced by cars and trucks, it is the by-product of internal combustion engines. Smog consists of fine particulates, called soot, and numerous chemicals. These include nitrogen oxides, volatile hydrocarbons, ozone, and carbon monoxide. During rush hour, a high concentration of nitrogen oxides and hydrocarbons are emitted by cars and trucks. These chemicals react with oxygen and water in the air to form more complex chemical compounds that turn the air a distinct shade of brown. This type of air pollution is known as photochemical smog, because it is catalyzed by light from the Sun, and is more common during the summer months when sunlight is brightest. Smog can be harmful to animals (including humans) if inhaled for prolonged periods of time. Some air pollution creates acid rain that also compounds contamination of soil and water systems.

Chemistry's Impact on Global Climate Change

Another impact of chemical reactions is climate change. The burning of fossil fuels, whether to generate electricity or to power cars and trucks, causes the amount of greenhouse gases in the atmosphere to increase. As the number of power plants and the number of cars increase, the amount of greenhouse gases increases in the atmosphere also. This causes the heat naturally released by the ground after it has been exposed to sunlight to become trapped. This trapping of heat increases the global average temperature. Temperatures have already increased by over a degree Celsius compared to the global average over the last 100 years. Scientists predict that if we continue to burn fossil fuels at the current rate, we may experience temperature increases of more than four degrees Celsius. These increased temperatures can affect growing seasons and locations. Foods that need to be grown in cooler climates will no longer grow well in the same area if it is too warm. This change in food production will impact natural food webs and human agriculture.

Original Text: Nothing New Under the Sun Skit

Driving Question

How did the Sun's energy end up in your electricity?

Goals • The skit should be three to five minutes in length. • Include information about the following topics: ◦ The basic energy conversion in a generator: mechanical to electric ◦ One of the following resources for powering a generator: wind, fossil fuel, moving water, or solar power ◦ How the Sun is ultimately the source of the energy behind the resource you have chosen ◦ How the Sun is ultimately the source of the energy you use to operate a do-it-yourself generator

Page 2964 of 3538

Original Text: Today, more doors are open, and women and people of color increasingly push the boundaries of scientific knowledge. For example, Dr. Kizzmekia Corbett, shown in Figure 11, led a team at the National Institutes of Health (NIH) that helped develop the SARS-CoV-2 vaccine. In addition to her laboratory work, Dr. Corbett leads community outreach, working to explain the safety and efficacy of vaccines.

Other women leading cutting-edge research include Dr. Ting Xu at the University of California at Berkeley and Dr. Rona Chandrawati at the University of South Wales, both of whom research nanotechnology.

Dr. Xu's work with energy storage systems and printable solar cells has the potential to revolutionize renewable energy. Dr. Chandrawati's work focuses on smart labels that detect when food becomes contaminated, a technology that would greatly increase the safety of the world's food supply.

Location: Text under header Graphing Motion

Original Text: The motion of an object over a period of time can be shown on a distance-time graph. For example, the graph in Figure 8 shows the distance traveled by three swimmers during a 30-minute workout. Time is plotted along the horizontal axis of the graph, and the distance traveled is plotted along the vertical axis of the graph. Each axis must have a scale that covers the range of numbers to be plotted. In Figure 8, the distance scale must range from 0 to 2400 m, and the time scale must range from 0 to 30 min. Next, the x-axis is divided into equal time intervals, and the y-axis is divided into equal distance intervals. Once the scales for each axis are in place, the data points can be plotted. In Figure 8, there is a data point plotted for each swimmer every 2.5 minutes. After plotting the data points, a line is drawn to connect the points.

Updated Text: Table 3 shows the position of a runner for each second of their 6-second sprint down a track. Their motion over this time can be shown on a position-time graph. Time is plotted along the horizontal axis of the graph, and the position of the runner is plotted along the vertical axis of the graph.

Each axis must have a scale that covers the range of numbers to be plotted. In Figure 8, the position scale must range

from 0.0 to 30.0 m, and the time scale must range from 0.0 to 6.0 s. Next, the x-axis is divided into equal time intervals, and the y-axis is divided into equal distance intervals. Once the scales for each axis are in place, the data points can be plotted. In Figure 8, there is a data point plotted for the runner every 1.0 s. After plotting the data points, a line is drawn to connect the points.

Location: First paragraph under header Velocity

Original Text: Suppose a hurricane is traveling at a speed of 20 km/h, is located 500 km east of your location.

Should you worry? Unfortunately, you do not have enough information to answer that question.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2970 of 3538

Knowing only the speed of the storm is not much help. Speed describes only how fast something is moving. To decide whether you need to move to a safer area, you also need to know the direction that the storm is moving. In other words, you need to know the velocity of the storm. Velocity includes the speed of an object and the direction of its motion. Velocity has the same units as speed, m/s.

Updated Text: A hurricane traveling at a speed of 20 km/h is 500 km east of you. Should you worry? Unfortunately, you do not have enough information. Speed only describes how fast something is moving. To decide whether you need to move to a safer area, you also need to know the direction the storm is moving. In other words, you need to know the storm's velocity. Velocity includes the speed of an object and its direction of motion. Velocity has the same units as speed, m/s, and can be calculated in similar way:

Original Text: When an object travels in a straight line and does not change direction, a graph of speed versus time can provide information about the object's acceleration.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 2972 of 3538

Figure 19 shows the speed-time graph of Tamara's car as she drives to the store. Just as the slope of a line on a distance-time graph is the object's speed, the slope of a line on a speed-time graph is the object's acceleration. For example, when Tamara pulls out of her driveway, the car's acceleration is 0.33 km/min^2 , which is equal to the slope of the line from $t = 0$ to $t = 0.5 \text{ min}$.

Updated Text: When an object travels in a straight line and does not change direction, a graph of velocity versus time can provide information about the object's acceleration. Figure 19 shows the velocity-time graph of Tamara's electric car as she drives from one intersection to another. Just as the slope of a line on a displacement-time graph is the object's velocity, the slope of a line on a velocity-time graph is the object's acceleration. For example, when Tamara approaches a stop sign, the car's acceleration is -1.0 m/s^2 , which is equal to the slope of the line from $t = 10.0$ to $t = 18.0 \text{ s}$. We can see that the slope of the velocity-time graph matches the acceleration in the acceleration-time graph.

Current Page Number(s): 77

Location: The third paragraph after header Impulse

Original Text: How is impulse calculated? Picture kicking a soccer ball that is moving toward you. As your foot strikes the ball, the force of your foot changes the ball's velocity. This force changes over time, first slowing the ball's motion, then stopping it briefly, finally sending the ball in another direction. The impulse is the average force applied by your foot multiplied by the length of time your foot was in contact with the ball. For example, if the kick took approximately 0.5 s, and the average force you applied was 20 N, the impulse would be 10 N·s.

Updated Text: Safety devices use the concept of impulse to reduce the forces on a person during a collision. For example, when a baseball strikes a batter, all its momentum is imparted into the batter. If the batter is not wearing a helmet, the impulse from the ball happens very quickly and results in a large force. If the batter is wearing a helmet, the helmet increases the amount of time it takes the ball to transfer its momentum into the batter. This greatly decreases the

amount of force applied to the batter and reduces the risk of injury by over 75%. Manufacturers continuously evaluate and refine their helmet designs and materials to make playing sports safer.

Throughout this chapter you studied energy sources and how using the energy impacts the environment.

Think About It Review these questions to understand how we get the energy we need with the least impact on the environment.

- How do you use fossil fuels, and what is its impact on the environment?
- How could you change your lifestyle to decrease the negative impact on the environment when you use energy?

Location: Three paragraphs under header Opaque, translucent, and transparent

Original Text: An object's material determines the amount of light it absorbs, reflects, scatters, and transmits. The candleholder material on the right in Figure 2 is opaque (oh PAYK). Opaque materials only absorb and reflect light; no light passes through them. As a result, you cannot see the candle inside.

Some materials, such as the candleholder in the middle in Figure 2, are translucent (trans LEW sunt). Translucent materials transmit light but also scatter it.

You cannot see clearly through translucent materials, and objects appear blurry.

The candleholder on the left in Figure 2 is transparent. Transparent materials transmit light without scattering it, so you can see objects clearly through them.

Updated Text: An object's material determines the amount of light it absorbs, reflects, scatters, and transmits. The candleholder material in Figure 2A is opaque (oh PAYK). Opaque materials only absorb and reflect light; no light passes through them. As a result, you cannot see the candle inside.

Some materials, such as the candleholder in Figure 2B, are translucent (trans LEW sunt). Translucent materials transmit light but also scatter it. You cannot see clearly through translucent materials, and objects appear blurry.

The candleholder in Figure 2C is transparent. Transparent materials transmit light without scattering it, so you can see objects clearly through them.

Current Page Number(s): 310

Location: The two paragraphs under header Coherent and incoherent light

Original Text: The beams from a laser light do not spread out because laser light is coherent.

Coherent light is light of only one wavelength that travels in one direction with a constant distance between the corresponding crests of the waves. This is illustrated in Figure 21. Coherent waves combine to form a single wave.

The light from an ordinary lightbulb is incoherent. Incoherent light can have more than one wavelength, can travel in more than one direction, and does not travel with a constant distance between the corresponding crests of the waves.

This is also illustrated in Figure 21. Since the beam spreads out, the energy carried by these light waves is spread over a large area.

Updated Text: The beams from a laser light do not spread out because laser light is coherent. Coherent light is light of only one wavelength that travels in one direction with a constant distance between the corresponding crests of the waves. This is illustrated in Figure 21A. Coherent waves combine to form a single wave.

The light from an ordinary lightbulb is incoherent. Incoherent light can have more than one wavelength, can travel in more than one direction, and does not travel with a constant distance between the corresponding crests of the waves.

This is also illustrated in Figure 21B. Since the beam spreads out, the energy carried by these light waves is spread over a large area.

Updated Text: Define chemical change

Component: McGraw Hill Texas Integrated Physics and Chemistry Student Edition

ISBN: 9780076981687

Current Page Number(s): 381

Location: Paragraphs under headers Physical weathering and Chemical weathering

Original Text: Physical weathering

Fast moving water can cause physical weathering of rocks by moving the rocks around, causing small pieces to break off. As the water passes over rocks continuously, it smooths and sculpts the rocks, as shown in Figure 18. When water in the cracks of rocks repeatedly freezes and thaws, pieces of rock can break off and large rocks can even split in half. Recall that water expands when it freezes, forming a wedge that puts pressure on the rock on either side of a crack. Another example of physical weathering occurs when plant roots break apart rocks, such as when plant roots have caused cracks in a sidewalk.

Chemical weathering

In other cases, the change is chemical. For example, solid calcium carbonate, a compound found in limestone, reacts with slightly acidic water. The calcium carbonate reacts to form calcium bicarbonate. This change in limestone is a chemical change because the identity of the substances changes. This type of chemical weathering shaped the White Cliffs of Dover, shown in Figure 18.

Updated Text: Physical weathering

Fast moving water can cause physical weathering of rocks by moving the rocks around, causing small pieces to break off. As the water passes over rocks continuously, it smooths and sculpts the rocks, as shown in Figure 18A. When water in the cracks of rocks repeatedly freezes and thaws, pieces of rock can break off and large rocks can even split in half. Recall that water expands when it freezes, forming a wedge that puts pressure on the rock on both sides of a crack. Another example of physical weathering occurs when plants' roots break apart rocks, such as when roots have caused cracks in a sidewalk.

Chemical weathering

In other cases, the change is chemical. For example, solid calcium carbonate, a compound found in limestone, reacts with slightly acidic water. The calcium carbonate reacts to form calcium bicarbonate. This change in limestone is a chemical change because the identity of the substances changes. This type of chemical weathering shaped the White Cliffs of Dover, shown in Figure 18B.

Location: Two paragraphs after header Bonding in nonmetals

Original Text: Nonmetals become negative ions when they gain electrons from metals.
Calcium fluoride (CaF₂), which is shown in Figure 13, is an ionic compound. It
forms from the nonmetal fluorine and the metal calcium.

When bonded with other nonmetals, atoms of nonmetals usually share
electrons to form covalent bonds. Compounds made of atoms that are
covalently bonded are called covalent compounds. The covalent compound
carbon dioxide (CO₂) is shown in Figure 13. The solid carbon dioxide shown in
this image is sometimes called dry ice. At room temperature, carbon dioxide is
normally a gas that you exhale and that plants need to survive.

Updated Text: Nonmetals become negative ions when they gain electrons from metals.
Calcium fluoride (CaF₂), which is shown in Figure 13A, is an ionic compound. It
forms from the nonmetal fluorine and the metal calcium.

When bonded with other nonmetals, atoms of nonmetals usually share
electrons to form covalent bonds. Compounds made of atoms that are
covalently bonded are called covalent compounds. The covalent compound
carbon dioxide (CO₂) is shown in Figure 13B. The solid carbon dioxide shown in
this image is sometimes called dry ice. At room temperature, carbon dioxide is
normally a gas that you exhale and that plants need to survive.

Location: Two paragraphs after header Buckyballs.

Original Text: Buckyballs In the mid-1980s, a new allotrope of carbon was discovered called buckminsterfullerene. This soccer-ball-shaped molecule is shown in Figure 19 and is informally called a buckyball. It was named after R. Buckminster Fuller, an architect-engineer who designed buildings with similar shapes.

In 1991, scientists were able to use buckyballs to make, graphite-like tubes, like those in Figure 19. These tubes, called nanotubes, are about one-billionth of a meter in diameter. You could stack thousands of nanotubes to get the thickness of one piece of paper. Nanotubes might be used someday to make stronger building materials and to make computers that are smaller and faster.

Original Text: DRIVING QUESTION CONNECTION You just learned about some of the physical properties of alloys used in plane production. Aluminum and titanium alloys are strong, lightweight and long-lasting, making them great materials for planes. While we may not travel by plane daily, air travel is a convenience to human life. We are able to travel increased distances in shorter periods of time and can also transport goods and supplies. How has air travel impacted your life?

Updated Text: DRIVING QUESTION CONNECTION Aluminum and titanium alloys are strong, lightweight, and long-lasting, making them great materials for planes. While we may not travel by plane daily, air travel is a convenience to human life. We can travel longer distances in shorter periods of time and can also quickly transport goods and supplies.

Location: Paragraph under header Ceramics in medicine

Original Text: Ceramics also have medical uses. Replacement hip sockets are made of ceramics because they are safe for use in the human body. Ceramics have physical properties including strength and durability which make them useful to everyday life. Ceramics also have chemical properties that make them useful to biomedical sciences. They can be composed of ions that are found throughout the body as well as ions that have limited toxicity when exposed to living tissue. This makes them a valuable resource in medical advancement. Ceramics are resistant to body fluids, which can damage other materials. They are relatively nonreactive and are resistant to rejection by the body. In the medical field, surgeons use ceramics in conjunction with alloys for the repair and replacement of joints such as hips, knees, shoulders, elbows, fingers, and wrists. Dentists use ceramics for braces as well as tooth replacement and repair.

Updated Text: Ceramics also have medical uses. In addition to their physical properties of durability and strength, ceramics have chemical properties that make them useful in biomedical sciences. Ceramics can be composed of ions that are found throughout the body as well as ions that have limited toxicity when exposed to living tissue. This makes them a valuable resource in medical advancement. Ceramics are also resistant to body fluids that can damage other materials. They are relatively nonreactive and are resistant to rejection by the body. As a result, surgeons use ceramics in conjunction with alloys for the repair and replacement of joints such as hips, knees, shoulders, elbows, fingers, and wrist. For example, replacement hip sockets are made of ceramics because they are safe to use in the human body. Dentists also use ceramics for braces and tooth replacement and repair.

Original Text: Beginning

Write the verb on the board: compare. Using gestures and other such visuals to support comprehension, model comparing two things. For example, compare your desk with a student's desk and ask yes/no questions. You might ask: Is my desk smaller than the student desk? Do both desks have drawers? After that, check comprehension, again, using gestures and other such comprehensible input. Give a basic description of something and ask: Am I comparing. Then compare two things and again ask: Am I comparing?

Intermediate

Write the verb on the board: compare. Using gestures and other such visuals to support comprehension, model comparing two things. For example, compare your desk with a student's desk and ask basic questions. You might ask: Which desk is smaller? What do both desks have? What does only my desk have? What does only the student desk have? After that, check comprehension, again, using gestures and other such comprehensible input. Give a basic description of something and ask: Am I comparing. Then compare two things and again ask: Am I comparing?

Original Text: Apply Your Knowledge | 10 minutes

Have two students of different sizes stand facing one another and push on each other's hands without either one being pushed over. Ask who is exerting the larger force. They both exert the same force. Have one student stand in stockings feet so that they slide when pushed. Now which one exerts the greater force? They are still the same. Ask students why one person moves and the other does not, if the forces are the same. One has a higher frictional force keeping them stationary.

Updated Text: CER: Newton's Laws of Motion | Assignments | 10 minutes

Have students return to this activity to record their evidence, revise their claims, and explain their reasoning in answer to the essential question, "How do forces affect acceleration?"

Component: McGraw Hill Texas Integrated Physics and Chemistry Teacher Edition

ISBN: 9781265771430

Current Page Number(s): 127

Location: Second paragraph under Extention

Original Text: Have students create a table for the data and add a column for force. Ask how force can be calculated from these data. by multiplying the mass of the car (2 kg) by each acceleration Instruct students to calculate the force necessary to cause the acceleration for each second. Then, have students create a graph of the data with force on the y-axis and acceleration on the x-axis. Student graphs should be a straight line. Point out to students that the slope of the line is equal to the car's mass. You can illustrate this by having students use the same acceleration data for a 3-kg car. The slope of the resulting force v. acceleration graph will be 3.

Updated Text: Have students create a table for the data and add a column for force. Ask how force can be calculated from these data, by multiplying the mass of the car (2 kg) by each acceleration. Instruct students to calculate the force necessary to cause the acceleration for each second. Then, have students create a graph of the data with force on the y-axis and acceleration on the x-axis. Student graphs should be a straight line. Point out to students that the slope of the line is equal to the car's mass. You can illustrate this by having students use the same acceleration data for a 3-kg car. The slope of the resulting force v. acceleration graph will be 3.

Original Text: Extension | 10 minutes EXTEND

Have students hang an object from a spring scale to determine its weight. Next, have them compare this with the force recorded on the scale when the object is moved rapidly up and down. Have students explain the results. The downward force exerted by the object on the scale is the force recorded on the scale, and it equals the upward force exerted by the scale on the object. When the object is accelerating upward, the upward force on the object exerted by the scale is greater than its weight. When the object is accelerating downward, the upward force on the object exerted by the scale is less than its weight.

Updated Text: [green checkmark icon] [Assignments icon]CER: Using Newton's Laws | Assignments | 10 minutes

Have students return to this activity to record their evidence, revise their claims, and explain their reasoning in answer to the essential question, "How do Newton's three laws explain the change of motion that occurs in a collision?"

Location: Exit Tickets

Original Text: Topic: Definition of Work
How much work is done on a box in each of the following cases?
a) A force of 85 N is exerted to lift the box, but the box does not move.
b) The force is then increased to 98 N and the box is lifted 1.5 m.
a) No work is done because there is no motion.
b) $W = Fd = (98 \text{ N})(1.0 \text{ m}) = 98 \text{ J}$

Topic: Machines

A steering wheel is turned through a distance of 0.24 m with a force of 15 N.
a) If the steering wheel has a mechanical advantage of 10, how much force is exerted on the axle?

a) 150 N

b) Suppose the steering wheel is only 75% efficient, due to friction. What is the output work of the steering wheel?

b) $W_{\text{in}} = Fd = (15 \text{ N})(0.24 \text{ m}) = 3.6 \text{ J}$

$W_{\text{out}} = W_{\text{in}} \times e/100 = (3.6 \text{ J})(75/100) = 2.7 \text{ J}$

Topic: Change Requires Energy

Describe the relationship between energy and work. Energy can be defined as the ability to do work. When one system does work on a second system, energy is transferred from the first system to the second system. Energy and work are both measured in joules.

Topic: Different Forms of Energy

Calculate the following:

a) the kinetic energy of a 0.145 kg baseball traveling at 22 m/s

b) the gravitational potential energy in a diver-water system if the diver has a mass of 55 kg and is standing on a platform 5.0 m above the water.

a) $KE = \frac{1}{2} mv^2 = \frac{1}{2} (0.145 \text{ kg}) (22 \text{ m/s})^2 = 35 \text{ J}$

b) $GPE = mgh = (55 \text{ kg}) (9.8 \text{ N/kg}) (5.0 \text{ m}) = 2700 \text{ J}$

Updated Text: Exit Tickets

Original Text: Quick Demo: Series and Parallel Circuits | 5 minutes

Materials battery, small lightbulbs (2), ammeters (2), wire Set up a series circuit with the two lightbulbs. Include ammeters in two places in the circuit. Disconnect one lamp so the circuit is broken. Do the same for a parallel circuit. In the series circuit, the entire circuit is broken when the lamp is disconnected. For the parallel circuit, the circuit is only broken in the branch with the disconnected lamp. Ask: Why do results differ for the two circuits? The series circuit has only one path, so the current is the same everywhere; the parallel circuit has two paths, so the current is split between two paths.

Updated Text: Quick Demo: Series and Parallel Circuits | 5 minutes

Materials battery, small lightbulbs (2), ammeters (2), wire

Procedure Disconnect one lamp so the circuit is broken. Do the same for a parallel circuit. In the series circuit, the entire circuit is broken when the lamp is disconnected. For the parallel circuit, the circuit is only broken in the branch with the disconnected lamp. Ask: Why do results differ for the two circuits? The series circuit has only one path, so the current is the same everywhere; the parallel circuit has two paths, so the current is split between two paths.

Original Text: Before students read the lesson, review the meaning of some of the English terms such as look closer, compare, ask yourself, explain, etc. used routinely in classroom materials.

Beginning

Point out the commands such as look closer and compare in the text on page 151. Give a demonstration of the meaning of each one and then create a chart with these words to serve as a reference. For example, for look closer, pantomime looking closer at the text or a figure and studying the picture carefully, say: Look closer means to look at something and think about it. For compare demonstrate by comparing two objects (two books, two pencils, etc.) and then say: Compare means to say how two or more things are the same or different. Write the commands on the board as sentences (Look closer. Compare.) and point out how the structure is simple, and it doesn't need the subject (you). Say: These are commands. Commands tell us what to do. With students, look for other commands in the lesson.

Intermediate

Point out the commands such as look closer and compare in the text on page 151. Give a demonstration of the meaning of each one and then create a chart with these words to serve as a reference. For example, for look closer, pantomime looking closer at the text or a figure and studying the picture carefully, say: Look closer means to look at something and think about it. For compare demonstrate by comparing two objects (two books, two pencils, etc.) and then say: Compare means say how two or more things are the same or different. Write the commands on the board as sentences (Look closer. Compare.) and point out how the structure is simple, and it doesn't need the subject. Say: These are commands. Commands tell us what to do. With students, look for other commands in the lesson and read them aloud. Support their understanding of what each is telling them to do. Have them create a poster with the commands they see throughout the chapter.

Advanced/Advanced High

Point out the instructions for Figure 23 on page 151. Explain that these are commands, and they tell us what to do. Ask students to explain what their task is for the instructions on page 151. (Look closer. Compare.) Elicit that they are to look at the figure, think about it and compare the voltage differences. Have them locate other commands in the lesson and explain what they are supposed to do for each task.

Original Text: Page 192 Figure 7 Look Closer Describe which stage in this process is the most efficient. Stage 2 is most efficient because about 90 percent of the thermal energy from the heated water is transformed into thermal energy in steam.

Updated Text: Page 193 Ask Yourself Summarize the transformations of energy that occur producing electricity from fossil fuels. Fuel burned in a boiler or combustion chamber converts chemical potential energy into thermal energy used to heat water. The pressurized steam spins the blades of a turbine, converting thermal energy into mechanical energy. The shaft of the turbine connects to an electric generator, which converts mechanical energy into electrical energy.

Original Text: Content Background: Chernobyl

After the Chernobyl accident in 1986, people throughout the world became concerned about the safety of nuclear reactors. Although all reactors have some risks, reactors in the United States are far safer than the one in Chernobyl. Most importantly, the Chernobyl reactor did not have a containment shell that could prevent the escape of radioactive materials.

Updated Text: [Red box][labs icon]Lab: Comparative

Engage in Scientific Argumentation | Labs | 50 min

Students will research nuclear energy production, its advantages and disadvantages, and its future development. Students will then develop arguments from evidence and engage in scientific argumentation in a debate with their classmates.

ISBN: 9781265771430

Current Page Number(s): 342

Location: Between Topic: Fission and Topic: Nuclear Reactor

Original Text: N/A

Updated Text: Topic: The Nuclear Chain Reaction

What is the role of neutrons in the chain reaction that occurs in a nuclear power plant reactor? Neutrons are released when a uranium nucleus experiences fission. These neutrons can then strike other uranium nuclei, causing them to experience fission as well, keeping the chain reaction going. Control rods can be used to capture the released neutrons to control the rate of the fission.

Original Text: Large telescopes use mirrors to capture and focus
light from distant objects onto instruments that use it
to form images.

Updated Text: Large telescopes tend to use mirrors instead of lenses because large mirrors are easier and less expensive
to make than large lenses. In the largest telescopes, mirrors are used because lenses of equivalent size would be too
heavy to support.

Original Text: Clarify a Preconception | 5 minutes

Some students may confuse pressure with force. Emphasize that pressure is the quotient of force divided by the area over which it is exerted. The Pressure Equation box (and Example Problem 1) will lead to a better understanding of the relationship between pressure and force.

Updated Text: [video icon]Example Problem Video: Pressure | Videos | 5 minutes

Students will learn how to calculate force using the pressure equation.

[video icon]Example Problem Video: Pascal's Principle | Videos | 5 minutes

Students will learn how to calculate input force using Pascal's principle.

Original Text: Extension | 10 minutes EXTEND
Explain to students that viscosity is a measure of a fluid's resistance to flow. Have students conduct research about the viscosity ratings of motor oils and which ratings are best for different types of climates. Higher viscosity oils have more resistance to flow and are used in warm weather, but lower viscosity oils flow more easily and are used in cold temperatures.

Original Text: Support students with the meaning of subatomic and how it relates to atoms.

Beginning

Explain the meaning of subatomic particles when describing the composition of an atom. Point out the sentence in the Driving Question Connection on page 387 about what atoms are composed of ("Atoms are composed of even smaller

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3125 of 3538

particles—subatomic particles--called protons, neutrons, and electrons...”). Sketch the meaning of this sentence by drawing a circle and labeling it atom. Then within the circle, draw clusters of dots and label each cluster protons, neutrons, electrons. Point to inside the atom of the sketch and say: An atom has subatomic particles in it. Protons, neutrons and electrons are inside an atom. Have students repeat the word subatomic and point to the protons, neutrons and electrons. Confirm understanding by asking yes/no questions. Ask: Are there smaller parts to an atom? Are protons inside an atom? Are atoms in protons?

Intermediate

Explain the meaning of subatomic particles when describing the composition of an atom. Point out the sentence in the Driving Question Connection on page 387 about what atoms are composed of (“Atoms are composed of even smaller particles—subatomic particles—called protons, neutrons, and electrons...”). Sketch the meaning of this sentence by drawing a circle and labeling it atom. Then within the circle, draw clusters of dots and label each cluster protons, neutrons, electrons. Point to inside the atom of the sketch and say: An atom has subatomic particles in it. Protons, neutrons and electrons are inside an atom. Have students repeat the word subatomic and point to the protons, neutrons and electrons. Confirm understanding by asking questions. Ask: What are the subatomic particles of an atom? Students respond with a sentence stem: The subatomic particles of an atom are _____.

Advanced/Advanced High

Explain the meaning of subatomic particles when describing the composition of an atom. Have students read the Driving Question Connection on page 387. Write the word atom on the board and underneath write protons, neutrons, electrons. Say: An atom has subatomic particles in it. Protons, neutrons and electrons are subatomic. Underline the prefix sub and say: Sub means under or beneath. Confirm understanding by asking questions. Ask: What does subatomic mean? What is inside an atom?

Updated Text: Support students with the meaning of subatomic and how it relates to atoms.

Beginning

Explain the meaning of subatomic particles when describing the composition of an atom. Point out the sentence in the Driving Question Connection on page 389 about what atoms are composed of (“Atoms are composed of even smaller particles—subatomic particles--called protons, neutrons, and electrons.”). Sketch the meaning of this sentence by drawing a circle and labeling it atom. Then within the circle, draw clusters of dots and label the clusters protons, neutrons, and electrons. Point to inside the atom of the sketch and say: An atom has subatomic particles in it. Protons, neutrons, and electrons are inside an atom. Have students repeat the word subatomic and point to the protons, neutrons, and electrons. Confirm understanding by asking yes/no questions. Ask: Are there smaller parts to an atom? Are protons inside an atom? Are atoms in protons?

Intermediate

Display Figure 6, which shows that most of the mass of the atom is concentrated in the nucleus. Ask students to use this image to explain why it takes a great deal of energy to compress two of these atoms so that their nuclei touch. The nucleus is positively charged due to its protons. As the two atoms approach each other, the repulsive force between their nuclei increases. Therefore, the amount of energy required to compress the two atoms increases as the distance between their nuclei decreases.

Updated Text: Scientific Shorthand

Ask students why it is important that there is only one set of abbreviations for elements that is used around the world. So that scientists can communicate chemical information to each other regardless of what language they speak.

Subatomic Particles

Display Figure 6, which shows that most of the mass of the atom is concentrated in the nucleus. Ask students to use this image to explain why it takes a great deal of energy to compress two of these atoms so that their nuclei touch. The nucleus is positively charged due to its protons. As the two atoms approach each other, the repulsive force between their nuclei increases. Therefore, the amount of energy required to compress the two atoms increases as the distance between their nuclei decreases.

Original Text: Beginning

Before you introduce the periodic table, activate prior knowledge on vocabulary words related to talking about tables. Draw a simple 3 column/3 row chart on the board. Say: This is a table. Ask students to find other tables in the text. Point to the rows of the table on the board and ask: What are these? If no reply, say: These are rows. Point to the columns and ask: What are these? If no reply, say: These are columns. Write the words and have students repeat them aloud. Show the periodic table and ask students to point to the rows and the columns within the chart.

Intermediate

Before you introduce the periodic table, activate prior knowledge on vocabulary words related to talking about tables. Draw a simple 3 column/3 row chart on the board. Point to the rows and ask: What are these? If no reply, say: These are rows. Point to the columns and ask: What are these? If no reply, say: These are columns. Show the periodic table and ask students to point to the rows and the columns within the chart. Tell students to read the paragraph about Figure 8. Ask what the difference is between the early periodic table by Mendeleev and the modern periodic table. Provide students with a sentence frame to make their comparison. Students complete the blanks with the correct words from the paragraph: The early periodic table arranged elements in _____ (rows) based on _____ (increasing atomic mass) and in _____ (columns) based on _____ (elements that share same physical and chemical properties). However, in the modern periodic table, the elements are arranged by _____ (increasing atomic number—not atomic mass—and by periodic changes in physical and chemical properties.)

Advanced/Advanced High

Show the periodic table and ask students to point to the rows and the columns within the chart. Tell students to read the paragraph about Figure 8. Ask students to compare the early periodic table by Mendeleev and the modern periodic table. Elicit connecting words such as however and although.

Updated Text: Beginning

Intermediate

Before you introduce the periodic table, activate prior knowledge on vocabulary words related to talking about tables. Draw a simple three-column/three-row chart on the board. Point to the rows and ask: What are these? If there is no reply, say: These are rows. Point to the columns and ask: What are these? If there is no reply, say: These are columns. Show the periodic table, and ask students to point to the rows and the columns within the chart. Tell students to read the last paragraph on p. 400 in the text. Ask what the difference is between the early periodic table by Mendeleev and the modern periodic table. Provide students with a sentence frame to make their comparison. Students will complete the blanks with the correct words from the paragraph: The early periodic table arranged elements in _____ (rows) based on _____ (increasing atomic mass) and in _____ (columns) based on _____ (elements that share the same physical and chemical properties). However, in the modern periodic table, the elements are arranged by _____ (increasing atomic number—not atomic mass—and by periodic changes in physical and chemical properties.)

Advanced/Advanced High

Show the periodic table, and ask students to point to the rows and the columns within the chart. Tell students to read the last paragraph on p. 400 in the text. Ask them to compare the early periodic table by Mendeleev and the modern periodic table. Elicit connecting words such as however and although.

Original Text: Ask Yourself How can you tell whether a chemical equation is balanced or not?

Updated Text: Ask Yourself Summarize how you can tell whether a chemical equation is balanced or not.

Component: McGraw Hill Texas Integrated Physics and Chemistry Teacher Edition

ISBN: 9781265771430

Current Page Number(s): 840

Location: Answer Key, page 492

Original Text: Ask Yourself Explain why chemists use masses in grams instead of atomic mass units (u). At the scales commonly used for chemical reactions in a lab, grams are more practical than atomic mass units, u. Grams can be easily measured on lab equipment. Expressing the same amounts in u would require using very large numbers.

Updated Text: Ask Yourself Explain why chemists use masses in grams instead of atomic mass units (u). Grams are more practical than atomic mass units (u) for expressing the quantities of chemicals typically used in the lab. Grams can be easily measured on lab equipment. Expressing the same amounts in u would require using very large numbers.

Original Text: Activate Prior Knowledge | 5 minutes

Have students brainstorm examples of chemical reactions that occur at different rates. List the reactions under three categories on the board: extremely fast, medium, extremely slow. Choose a medium or extremely slow reaction and ask students how they think the rate might be increased. Example: The rate at which a wooden log burns might be increased by reducing it to fine shavings or using a bellows to increase its contact with oxygen.

Reading Preview | 20 minutes

Place students in groups and have them brainstorm meanings of new vocabulary words. Assign a recorder in each group to take notes and share the group's ideas.

Updated Text: Activate Prior Knowledge | 5 minutes

Have students brainstorm examples of chemical reactions that occur at different rates. List the reactions under three categories on the board: extremely fast, medium, extremely slow. Choose a medium or extremely slow reaction and ask students how they think the rate might be increased.

Original Text: Ask Yourself Compare and contrast the effects of increased concentration of liquid reactants and decreased volume of gaseous reactants. Increased pressure/decreased volume of gaseous reactants increases their concentration. Hence, more particles are closer together, leading to an increased number of collisions and a greater likelihood of a faster reaction.

Updated Text: Ask Yourself Compare and contrast the effects of increased concentration of liquid reactants and decreased volume of gaseous reactants. A decrease in the volume of a gas increases the concentration of the gas. Hence, it increases the reaction rate as does an increase in concentration of liquid reactants due to an increase in the number of collisions occurring

Component: McGraw Hill Texas Integrated Physics and Chemistry Teacher Edition

ISBN: 9781265771430

Current Page Number(s): 903

Location: Theme: Patterns under header Topic: Effects of Solute Particles

Original Text: The freezing point and the boiling point of a solvent are both affected by the concentration of the solute particles in a solution. Have students create a graphic organizer that shows the effects of solute concentration on freezing point and boiling point. Before students create their graphic organizers, they should ask questions such as: How is freezing point affected by solute concentration? How is boiling point affected by solute concentration? How are the patterns of change different? How can I illustrate the patterns of change? Have students explain in writing why each shows a different pattern of change.

Updated Text: The freezing and boiling points of a solution are both affected by the concentration of the solute particles. Share the following data with students. Data for salt concentration in water (g/L) and boiling point of water (°C): 0, 100.0; 10, 100.2; 20, 100.4; 30, 100.5; 40, 100.6; 50, 100.8. Data for sucrose concentration in water (mol/L) and freezing point (°C): 0, 0.0; 1, -2.0; 2, -4.0; 3, -5.9; 4, -7.8; 5, -9.5. Have students organize the data in a graphic organizer such as a fish diagram, t-chart, or ladder to show the pattern that as solute concentration increases, boiling point increases and freezing point decreases.

Component: McGraw Hill Texas Integrated Physics and Chemistry Teacher Edition

ISBN: 9781265771430

Current Page Number(s): 903

Location: Driving Question Connection under header Topic: Effects of Solute Particles

Original Text: Salt compounds are held together by ionic bonds because they have an electrical charge. Salt dissolves when mixed with water due to water's covalent bonds. Covalent bonds are stronger than ionic bonds and therefore salt dissolves when mixed with water. Ask: Why doesn't sand dissolve in water? Water cannot break the bonds between sand molecules.

Updated Text: Salt compounds are held together by ionic bonds. Salt dissolves when mixed with water due to water's covalent bonds. Ask: Why doesn't sand dissolve in water? Water cannot break the bonds between the molecules in sand.

Original Text: Apply Your Knowledge: pH of a Solution | 5 minutes

Have students write chemical equations that show HCO_3^- acting to neutralize

OH^- ions and H^+ ions. $\text{HCO}_3^- + \text{OH}^- \rightarrow \text{H}_2\text{O} + \text{CO}_3^{2-}$; $\text{HCO}_3^- + \text{H}^+ \rightarrow \text{H}_2\text{CO}_3$

Explain that this equation demonstrates how one of the blood buffers works.

Updated Text: [red box][Lab icon] Lab: Descriptive

Acids, Bases, and Indicators | Labs | 50 minutes

Students will conduct this lab activity to investigate how a universal indicator is affected by acidic and basic solutions and determine the pH of several common liquids.

K. Aslihan Yener was born in Turkey. She became interested in archaeology and applied chemical technology to archaeology in the “analysis of lead isotopes found in the mines and metals located throughout the Near East.” Yener knew that the ratio of lead isotopes to other metals in Bronze Age objects would be like

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3179 of 3538

fingerprints. This insight enabled Yener to match the objects to the mine from which the metal originated. By doing this, Yener not only found evidence of a large-scale tin industry in the Taurus Mountains of Turkey but she also located a subterranean city built into the mountainside. Have students explain how determining which mine a metal came from enabled Yener to find evidence of Bronze Age industry.

Updated Text: [green checkmark][Assignment icon] CER: Alloys | Assignments | 10 minutes

Have students return to this activity to record their evidence, revise their claims, and explain their reasoning in answer to the essential question: How did we discover that mixing metals improves them?

Many polymers exist in nature. Silk from silkworms is a polymer. A turtle’s shell is made of polymers. Natural rubber and latex are polymers that come from trees. Our hair and fingernails are made from keratin, which is also a polymer.

Updated Text: Omission: Some sections in the text have misconceptions directly specified as such, for example, see the third Teacher Support listed in 2.1

[OL][AL] Explain that the word *kinematics* comes from a Greek term meaning motion. It is related to other English words, such as *cinema* (movies, or moving pictures) and *kinesiology* (the study of human motion).

[BL][OL] You may want to introduce the concept of a reference point as the starting point of motion. Relate this to the origin of a coordinate grid.

[AL] Explain that the reference frames considered in this chapter are inertial reference frames, which means they are not accelerating. Engage students in a discussion of how it is the difference in motion between the reference frame of the observer and the reference frame of the object that is important in describing motion. The reference frames used in this chapter might be moving at a constant speed relative to each other, but they are not accelerating relative to each other.

[BL][OL][Visual] Misconception: Students may assume that a reference frame is a background of motion instead of the frame from which motion is viewed. Demonstrate the difference by having one student stand at the front of the class. Explain that this student represents the background. Walk once across the room between the student and the rest of the class. Ask the student and others in the class to describe the direction of your motion. The class might describe your motion as *to the right*, but the student who is standing as a background to your motion would describe the motion as *to the left*. Conclude by reminding students that the reference frame is the viewpoint of the observer, not the background.

[BL] Have students practice describing simple examples of motion in the class from different reference frames. For example, slide a book across a desk. Ask students to describe its motion from their reference point, from the book's reference point, and from another student's reference point.

Before students begin the lab, arrange a location where pairs of students can have ample room to walk forward at least several meters.

As students work through the lab, encourage lab partners to discuss their observations. In Steps 1 and 3, students should observe the ball move straight up and straight down. In Step 2, students should observe the ball in a zigzag path away from the stationary observer.

After the lab, lead students in discussing their observations. Ask them which reference frame is the correct one. Then emphasize that there is not a single correct reference frame. All reference frames are equally valid.

Help students learn the difference between distance and displacement by showing examples of motion.

1. As students watch, walk straight across the room and have students estimate the length of your path.
2. Then, at same starting point, walk along a winding path to the same ending point.
3. Again, have students estimate the length of your path.

Ask—Which motion showed displacement? Which showed distance? Point out that the first motion shows displacement, and the second shows distance along a path. In both cases, the starting and ending points were the same.

[OL] Be careful that students do not assume that initial position is always zero. Emphasize that although initial position is often zero, motion can start from any position relative to a starting point.

[Visual] Demonstrate positive and negative displacement by placing two meter sticks on the ground with their zero marks end-to-end. As students watch, place a small car at the zero mark. Slowly move the car to students' right a short distance and ask students what its displacement is. Then move the car to the left of the zero mark. Point out that the car now has a negative displacement.

Students will learn more about vectors and scalars later when they study two-dimensional motion. For now, it is sufficient to introduce the terms and let students know that a vector includes information about direction.

[BL] Ask students whether each of the following is a vector quantity or a scalar quantity: temperature (scalar), force (vector), mass (scalar).

[OL] Ask students to provide examples of vector quantities and scalar quantities.

[Kinesthetic] Provide students with large arrows cut from construction paper. Have them use the arrows to identify the magnitude (number or length of arrows) and direction of displacement. Emphasize that distance cannot be represented by arrows because distance does not include direction.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3192 of 3538

Original Text: Today, more doors are open, and women and people of color increasingly push the boundaries of scientific knowledge. For example, Dr. Kizzmekia Corbett, shown in Figure 11, led a team at the National Institutes of Health (NIH) that helped develop the SARS-CoV-2 vaccine. In addition to her laboratory work, Dr. Corbett leads community outreach, working to explain the safety and efficacy of vaccines.

Other women leading cutting-edge research include Dr. Ting Xu at the University of California at Berkley and Dr. Rona Chandrawati at the University of South Wales, both of whom research nanotechnology. Dr. Xu's work with energy storage systems and printable solar cells has the potential to revolutionize renewable energy. Dr. Chandrawati's work focuses on smart labels that detect when food becomes contaminated, a technology that would greatly increase the safety of the world's food supply.

ISBN: 9780077006846

Current Page Number(s): 462

Location: Paragraph 1, sentences 3 through last

Original Text: Examine what happens when a wave travels from one medium to another. Figure 12 shows a wave pulse traveling from a larger spring into a smaller one. The pulse that strikes the boundary is called the incident wave. One pulse from the larger spring continues in the smaller spring, but the speed is different in the smaller spring. Note that this transmitted wave pulse remains upward. Some of the energy of the incident wave's pulse is reflected backward into the larger spring. This returning wave is called the reflected wave. Whether the reflected wave is upright or inverted depends on the characteristics of the two springs. For example, if the waves in the smaller spring have a greater speed because the spring is stiffer, then the reflected wave will be inverted. [note "incident wave" and "reflected wave" are highlighted yellow]

Updated Text: Examine what happens when a wave travels from one medium to another. Figure 12 shows a wave pulse traveling from one spring to another. The pulse that strikes the boundary is called the incident wave. One pulse from the left spring continues in the right spring. If the springs are identical, the pulse speed will be the same in both springs. If the springs have different properties, the speeds will be different. Note that this transmitted wave pulse remains upward.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Some of the energy of the incident wave's pulse is reflected backward into the left spring. This returning wave is called the reflected wave. Whether the reflected wave is upright or inverted depends on the characteristics of the two springs. For example, if the right spring is stiffer than the left, then the reflected wave will be inverted. [note "incident wave" and "reflected wave" are highlighted yellow]

Updated Text: Explain the changes observed in the spectrum of a glowing incandescent lightbulb as it gets brighter.

Component: McGraw Hill Texas Physics Student Edition

ISBN: 9780077006846

Current Page Number(s): 774

Location: Paragraph 1

Original Text: Why is the slope of every line in the graph equal to Planck's constant (h)? The maximum kinetic energy of an ejected electron is equal to the difference between the photon energy and the work function: $K_{E_{max}} = hf - hf_0$. The slope-intercept equation for a line is $y = mx + b$, where m is the slope of the line, x is the independent variable, y is the dependent variable, and b is the y -intercept. Substituting $K_{E_{max}} = y$, $f = x$, and $hf_0 = b$, you can observe that the slope of the line is Planck's constant h .

Current Page Number(s): 866

Location: Paragraph 1, sentence 1

Original Text: Subatomic particles in certain states can spontaneously decay into other particles. In β decay, a neutron decays into a proton, an electron, and a particle known as an electron anti-neutrino.

Updated Text: Subatomic particles in certain states can spontaneously decay into other particles. In β decay, a neutron decays into a proton, an electron, and a particle known as an electron antineutrino.

Component: McGraw Hill Texas Physics Student Edition

ISBN: 9780077006846

Current Page Number(s): 866

Location: Paragraph 2

Original Text: For example, physicists first discovered electron anti-neutrinos by applying the conservation laws to β decay. They observed that the combined energy of the electron and the proton from that decay was not equal to the energy of the neutron. There had to be another particle with the missing energy! From conservation of momentum and electric charge, physicists deduced this particle must have extremely low or zero mass and zero electric charge. This particle, the electron anti-neutrino, was first observed in 1956. You will learn more about neutrinos and anti-neutrinos in the next lesson.

Updated Text: For example, physicists first discovered electron antineutrinos by applying the conservation laws to β decay. Use with Example Problem 3.

Question

What is the average velocity of the object whose motion is represented in this graph? What is its average speed?

Answer

$$v = (50.0 \text{ m} - 0.0 \text{ m}) / (0.0 \text{ s} - 25.0 \text{ s}) = -2.00 \text{ m/s}$$

The average velocity is -2.00 m/s . The average speed is 2.00 m/s .

Updated Text: N/A

Component: McGraw Hill Texas Physics Teacher Edition

Component: McGraw Hill Texas Physics Teacher Edition

ISBN: 9781265775384

Current Page Number(s): 194

Location: last item on page, "Real-World Physics: Karate"

Original Text: Karate, meaning "empty hand," was developed in Okinawa, Japan, during the early 17th century as a means of self-defense because weapons were outlawed by rulers. It can take years of practice to learn the skills of karate, but with careful training even "empty hands" can break concrete blocks. A trained expert can break a concrete block 3.8-cm thick by moving his or her hand at 11 m/s to create 3069 N of force. Of course, the block exerts the same amount of force on the hand. The bones in the human hand can withstand up to 40 times more force than concrete.

Have students research the forces that the bones in the hand can endure, and how the angle at which the hand strikes the concrete block in karate determines the ability of the expert to break the block, whereas an error in the angle of attack could cause serious injury to the martial artist.

Updated Text: Karate, meaning "empty hand," was developed in Okinawa, Japan, during the early 17th century as a means of self-defense because weapons were outlawed by rulers. A trained expert can break a concrete block 3.8-cm thick by moving their hand at 11 m/s to create 3069 N of force. The block exerts the same amount of force on the hand. The bones in the human hand can withstand up to 40 times more force than concrete. Have students research the forces that the bones in the hand can endure, and how the angle at which the hand strikes the concrete block in karate determines the ability of the expert to break the block, whereas an error in the angle of attack could cause serious injury to the martial artist.

Component: McGraw Hill Texas Physics Teacher Edition

ISBN: 9781265775384

Current Page Number(s): 460

Location: last item on page, "Theme: Systems and System Models"

Original Text: Mathematical models can be used to predict the behavior of a system, but models can be limited. Choose an example of a mathematical model used to make an energy calculation based on a realistic situation, such as ice-skating or pushing different materials across different surfaces. What evidence do you have that the model is limited? Explain your model as well as its limitations to a peer. Review the situations and energy calculations in this book and

generate questions. Sample questions: Which realistic situation are you planning to model? What limitations does your model have? How are you going to mathematically model this situation?

Updated Text: Remind students that mathematical models can be used to predict the behavior of a system, but models can be limited. Tell them to choose an example of a mathematical model used to make an energy calculation based on a realistic situation, such as ice-skating or pushing different materials across different surfaces. Ask: What evidence do you have that the model is limited? Exact answers will vary depending on model chosen, but students might note things like ignoring friction or assuming an object is a point particle. Have students explain their models as well as their limitations to a peer.

Original Text: N/A

Updated Text: [arrows added to the diagram]

Component: McGraw Hill Texas Physics Teacher Edition

ISBN: 9781265775384

Current Page Number(s): 1010

Location: 3rd item on page, "Quick Demo: Heat from a Resistor"

Original Text: Materials 47- Ω , 10-W resistor; power supply; small polystyrene cup; water; thermometer
Procedure Connect the resistor to a variable power supply. Then submerge the resistor in a small polystyrene cup half-filled with water. Use a thermometer to measure the water temperature as current passes through the resistor. If time permits, run two trials, one with 10 V applied and one with 20 V applied, replacing the water between trials. Note the rate of temperature increase. Ask students to announce and record the temperature readings and draw a graph on the board.

Updated Text: Materials electric kettle; electrical outlet; water; thermometer
Procedure Have student examine the kettle's heating coil/element with the kettle unplugged from the power supply. Explain to students that a heating element acts as a resistor. Have them infer why a resistor might heat up the water. Then, fill the kettle with water, plug it into an electrical outlet, and turn it on. Be sure to follow any directions and specifications given by the manufacturer. Use a thermometer to measure the water temperature as current passes through kettle's coil/element. CAUTION: Do not let the thermometer touch the coil/element. Note the rate of temperature increase. Ask students to announce and record the temperature readings and draw a graph on the board.

Component: McGraw Hill Texas Physics Teacher Edition

ISBN: 9781265775384

Current Page Number(s): 1124

Location: 5th item on page, "Critical Thinking: Motors," prompt text

Original Text: A motor depends on the electromagnetic force on a current-carrying wire in a magnetic field. While in principle, Ampère's law can be used to calculate that magnetic field, in practice the law is seldom used. Have students describe how Faraday's law is useful in describing why, when a motor is rotating slowly, it draws more current than it does when it rotates rapidly.

Updated Text: A motor depends on the electromagnetic force on a current-carrying wire in a magnetic field. Faraday's law states that induced EMF is equal to the rate of change of the magnetic flux. Have students use to explain why, when a motor is rotating slowly, it draws more current than it does when it rotates rapidly.

Updated Text: [assignment icon] Applying Practices: Digital Transmission and Storage of Information | Assignments | 45 min

Students will compile and evaluate a list of questions regarding the advantages of digital transmission of information.

[assignment icon] Applying Practices: Catching Waves | Assignments | 100

Students will create a detailed timeline that communicates technical information about how some technological devices use the principles of wave behavior and wave interactions with matter to transmit and capture information and energy.

Updated Text: Quick Lab: Fluorescent Fingerprints 15 min

Component: McGraw Hill Texas Physics Teacher Edition

ISBN: 9781265775384

Current Page Number(s): 1175

Location: last item on page, "Reinforcement: Doppler Effect"

Original Text: Ask students to summarize what they learned in Chapter 17 about the Doppler effect. The Doppler effect is the change in frequency of a wave caused by the movement of the wave source, the detector, or both. Have students give their ideas about how the Doppler effect applies to electromagnetic waves. Because electromagnetic waves are waves, the Doppler effect applies to them. Explain that they will learn in this lesson how meteorologists use the Doppler effect to measure the velocities of storm systems.

Updated Text: Ask students to summarize what they learned in Chapters 16 and 17 about the Doppler effect. The Doppler effect is the change in frequency of a wave caused by the movement of the wave source, the detector, or both. Review with students how the Doppler effect applies to light. Ask them what this means for how the Doppler effect applies to other electromagnetic waves. Because electromagnetic waves are waves, the Doppler effect applies to them. Explain that they will learn in this lesson how meteorologists use the Doppler effect to measure the velocities of storm systems.

Current Page Number(s): 1239

Location: 3rd item on page "Careers: Laser Technician"

Original Text: Have interested students research laser technician careers. Students should investigate what laser technicians do as well as where they work. Students should report their findings to the class. A laser technician may produce, test, operate, and/or repair lasers. A technician might be employed by a hospital, a fiber-optics company, a research lab, a manufacturing plant, the military, the space program, or at construction sites. Some laser technicians are responsible for identification of flaws in machine parts, diagnosis of medical problems, or creation of holograms for applications such as on debit cards. A two- to four-year degree in laser technology is required to become certified as a laser technician.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Original Text: (1) [Flow chart with 5 boxes containing text. The first box says "Observations" and has an arrow pointing to the second box, which says "Hypothesis: A Hypothesis may be revised based on experimental data." An arrow points to the next box, which says "Experiments: An experiment can lead to observations that support or disprove a hypothesis." One arrow points from this box back to the box labeled Hypothesis, one arrow points down vertically to a box that says "Scientific Law: A scientific law summarizes the results of many observations and experiments" and one arrow points to the right to a box that says "Scientific theory: A theory is tested by more experiments and modified if necessary." Another arrows points back to the box labeled Experiments.]

(2) The flowchart shows the relationships between a scientific hypothesis, theory, and law. As shown by the arrows, the steps can occur in a variety of orders.

Updated Text: (1) [Venn diagram that compares theories and laws] Scientific Theory Explains why or how a broad class of related phenomena occur Example: Some diseases are caused by the invasion of the body by microorganisms. (Germ Theory)

Scientific Law Describes what happens under certain conditions, often using math Example: An object in motion stays in motion unless acted upon by an outside force. (Newton's first law of motion)

[middle shared section] - Can start as hypotheses that explain or describe - Backed by evidence - Can be used to make predictions - Can be revised

(2) The diagram shows how you can distinguish among scientific hypotheses, theories, and laws. Theories and laws have different purposes, and we often need both of them to understand the whole picture.

Procedure In this activity, students will read the article *What Are Income Taxes?* which explores the purpose of income taxes. Students will answer the following questions using the information they learned in the article. After your students have read the article and answer the questions individually, go over the questions as a whole class and ask for volunteers to share their answers.

DIRECTIONS Read the article *What are Income Taxes?* and be sure to note anything that stands out to you. Then answer the discussion questions that follow.

Taxes . . . can't live with 'em, can't live (in the U.S.) without 'em. Whether we like it or not, income taxes are as much a part of American life as baseball and apple pie. And while we groan and grumble as we fill out our tax returns every spring, our tax dollars help pay for a lot of the stuff we sometimes take for granted— like highways, schools, and national parks. Plus, if Uncle Sam doesn't get his fair share by Tax Day, you'll probably be hearing from the Tax Man. Trust us, you don't want that. It doesn't look like income taxes are going anywhere anytime soon, so what are they, how do they work, and how do you figure out how much of your hard-earned cash is going to the IRS every year? Let's take a closer look.

What Is an Income Tax? An income tax is a tax the government collects from money earned by businesses and individuals throughout the year. How much you pay in taxes depends on how much money you make in a year. In 2020, the IRS collected more than \$1.8 trillion in individual income taxes and another \$263.6 billion in income taxes from businesses. Together, those income taxes make up almost two-thirds of all the tax money Uncle Sam collects every year.¹ That's a lot of dough! Those income taxes are collected by the IRS, and then your tax dollars are used to fund a whole smorgasbord of public services— everything from military spending and education to transportation and medical research. In fact, individual income taxes have been the single largest source of federal revenue since 1950.² You're welcome, Congress!

Where Did the Income Tax Come From? Want someone to blame for your income tax bill this year? Look no further than Abraham Lincoln. Well, sort of. While "death and taxes" might be the only things that are certain in life, it wasn't always that way—at least not as far as income TEACHER MATERIAL 1. Internal Revenue Service Data Book, 2022. Publication 55-B, Washington, D.C. March 2023. 2. What Are the Sources of Revenue for the Federal Government? Tax Policy Center Briefing Book, 2020.

taxes are concerned. Income taxes as we know them today are actually barely more than 100 years old. In a controversial move, the first version of the personal income tax in the U.S. was signed into law by Lincoln during the Civil War as a way for the Union to pay for its war effort. Although the tax was repealed once the war was over, the debate over whether an income tax was constitutional or not raged on for decades. All of that changed in 1913. That was the year the 16th Amendment to the U.S. Constitution was ratified, legalizing the government's right to collect a federal income tax. That same year, Congress passed legislation that made income tax a part of American life. The rest, as they say, is history.

How Do Income Taxes Work? The U.S. tax system is progressive—that's just fancy tax talk that means the higher your taxable income, the more you'll pay in income taxes. Your tax rate (the percentages of your income that you pay in taxes) is based on which tax bracket (income range) you're in. The U.S. tax rates are marginal, which just means that each tax rate applies to only part of your income. Some of your income is taxed at 10%, another piece at 12%, and so on depending on how high your income is.

How Are Income Taxes Collected? If you're like most American employees with a salary, health benefits, and a 401(k), your employer probably sets aside some money from your paycheck for income taxes before it hits your bank account (those are called tax withholdings). Your employer uses the information you put on your W-4 tax form to figure out how much to withhold from each paycheck. When you fill out a tax return and file it with the IRS in the spring, you'll find out if you still owe the government anything in taxes or if you overpaid and Uncle Sam owes you a tax refund. Sounds simple enough, right? But what if you're self-employed (think freelancers, independent contractors, and small-business owners)? You'll probably pay your income taxes through quarterly taxes—or estimated taxes—that you file with the IRS every three months.

Regressive Taxes We've been talking a lot about federal income taxes, but there's a good chance those aren't the only type of income taxes you have to worry about. Though the U.S. mainly functions using a progressive tax system, there's a different type of tax system that exists called a regressive tax. Instead of getting taxed more if your

income is higher, a regressive tax doesn't change regardless of your income. Everyone pays the same tax rate, no matter how much or how little you make. This has been called a flat tax as well. Regressive taxes have been the center of much debate because of how they impact

people unequally, specifically those who have a lower income. This means that if the tax rate is 7%, someone who makes over \$100K a year will pay the same amount as someone making \$30K per year, which will have a greater financial impact on those making \$30K than those making \$100K. Regressive taxes have been called unfair because of the impact they make on low earners, but they're also seen as an incentive to work hard in your job and grow your income, since you wouldn't be penalized additionally based on how much you earn. Regressive taxes are typically seen on the state level and not the federal level, though excise taxes and certain taxes like Social Security and Medicare can be seen as regressive. Now that we've gone over the main types of taxes, let's take a deeper look at some of the different types of income taxes you might run into during tax season. State Income Taxes Uncle Sam isn't the only one who wants a piece of your income. Like the federal government, most states also have their own income tax system. Yuck. Where does your state income tax money go? More than half of state tax revenues are used to fund education and health care, in addition to other services like transportation, public assistance, and prisons.³ Now, each state falls into one of three different categories—states with progressive income taxes, states with a regressive (or flat) income tax, and states with no income tax at all. Let's dive into each one.

1. STATES WITH PROGRESSIVE INCOME TAXES Just like at the federal level, most states have a progressive tax structure with marginal tax rates. Again, all that boils down to is this: The more you earn, the more you'll be taxed. Each state sets their own tax rates and tax brackets, so if you live in one of the 32 states with a progressive tax structure, pay attention to which tax bracket and tax rates you fall into for your state. If you live in Hawaii, you could fall into one of 12 different tax brackets with tax rates between 1.4% and 11%. But Louisiana has just three tax brackets with tax rates between 2% and 6%. You might want to think about that before you move to a new state!⁴

2. STATES WITH FLAT INCOME TAXES There are nine states that keep things simple. Really simple. They have a flat tax rate, which is a regressive tax, and it doesn't matter how much or how little you earn—you're taxed at the same rate as everyone else. Here are the nine states that have a flat income tax structure: • Colorado • Illinois • Indiana³. Policy Basics: Where Do Our State Tax Dollars Go? Center on Budget and Policy Priorities, 2018. 4. Loughhead, Katherine. State Individual Income Tax Rates and Brackets for 2021. Tax Foundation, 2021.

3. STATES WITH NO INCOME TAX And then there are nine states that have no income tax at all! Here are the nine states with no income tax: • Alaska • Florida • New Hampshire • Nevada • South Dakota • Tennessee • Texas • Washington • Wyoming While not having a state income tax is nice, these states usually make up for lost revenue through other types of taxes, like sales taxes or property taxes, or reduced spending at the state level. Keep that in mind before packing up your stuff and crossing state lines!⁵ Business Income Taxes Own a small business? How you pay taxes on the profits you make depends on how your business is set up. If your business is a C corporation, your company's income tax rate is a flat 21% thanks to the Tax Cuts and Jobs Act of 2018 (it was 35% before that bill passed). But if the business is a pass-through entity, such as a sole proprietorship or a limited liability company (LLC), you won't pay corporate income taxes. The profits from your business "pass through" the business to you. So, you would fill out your personal tax return like you normally would and pay the taxes on those profits at your personal income tax rate.

Local Income Taxes Although most U.S. cities and counties don't add another layer of income tax on their residents, there are still nearly 5,000 local jurisdictions across 17 states—particularly in the Midwest and Northeast—that charge an income tax as of 2019.⁶ These local income taxes are mostly imposed by counties, municipalities, and school districts to pay for a wide range of civic services like parks, schools, and even garbage collection. But hey, depending on where you live, you might have to deal with federal, state, and local taxes . . . that's a lot!

Identifying Taxes Getting the full scope of the taxes you pay can be complex and will depend on the state and city you live in. Take a look at an example of the types of progressive and regressive taxes you'll see on the federal, state, and local levels on the following page.

TAX LEVEL PROGRESSIVE REGRESSIVE Federal Level Federal Income Taxes (from wages, investments, interest, rentals, or estate) • Excise Tax • Tariffs • Flat Tax • Payroll Tax (like Social Security or Medicare) • Sin Tax (taxes on harmful items like alcohol or tobacco) State Level* State-Imposed Income Tax Rates • Sales Tax • Excise Tax • Flat Tax • Fees (to state

museums or parks) • Sin Tax (state taxes on harmful items like alcohol or tobacco) • Payroll Tax Local Level* Local-Imposed Income Tax Rates • Property Tax • Flat Tax • Fees (to local museums or parks) • Sin Tax (local taxes on harmful items like alcohol or tobacco) • Payroll Taxes

* These taxes will be different depending on the state or city you're living in. Some areas have even decided not to have certain progressive or regressive taxes.

1. What kinds of public services do your income tax dollars pay for? Answers should include any of the following: military spending, education, transportation, and medical research.
2. What does it mean to say that the U.S. tax rates are marginal? It means that each tax rate applies to only part of your income.
3. What's the difference between a state income tax and a local income tax? A local income tax is a tax that's imposed by a county or even a school district and is much smaller in scope than a state income tax. Often it's used to pay for community needs like parks or schools while state income taxes cover spending at the state level.
4. What's a progressive income tax? Progressive income tax just means that the more you earn, the more you'll be taxed.
5. What are the benefits of a progressive tax? A progressive tax helps people with lower income specifically since those in a lower tax bracket pay less income tax and get to keep more money in their pockets.
6. What's a regressive income tax? A regressive income tax means everyone is taxed at the same rate, no matter how much or how little you earn
7. What are the benefits of a regressive income tax? A regressive tax wouldn't penalize someone who has worked hard to get a higher income and would allow them to keep more of their income.
8. How do most Americans pay their income taxes? Their employer withholds taxes from their paycheck, and they file a tax return to see if they're owed a refund or owe more.
9. Is paying a fee to visit your local state museum a progressive or regressive tax? Regressive
10. Are regressive property taxes typically paid at the federal, state, or local level? Local
11. Is Social Security considered a progressive tax or a regressive tax? Regressive
12. How many local jurisdictions have a specific local income tax? 5,000
13. If a state has a tax rate of 2-5% depending on your tax bracket, is it a progressive tax or a flat tax? Progressive
14. What's a tax you pay to buy items like alcohol or tobacco called? Sin tax
15. If your state says it has an income tax rate of 4.4%, is it a progressive tax or a regressive tax? Regressive tax

Copy and Pasted Content below:

Indirect vs. Direct Taxes The first thing that's important to understand is that nearly everything is taxed in one way or another, and there are two main types of taxes you'll experience. The first type is taxes you probably aren't aware you're paying—these are called indirect taxes. Whenever a company sells a good or service, they have to pay taxes on those products, but the company actually passes that tax on to you by including it in the price of the good or service. For example, a pair of shoes might cost the company \$10 to make, but they'll have to pay taxes on those shoes. Instead of paying it themselves, they'll sell the shoes for a higher price to make up for the tax. This probably sounds a little unfair, but keep in mind that this is one way that companies stay in good standing with the government while still having enough money to produce the products you want to buy. Without paying these indirect taxes, there wouldn't be as many companies for you to choose from, and there's a good chance prices would go up because of the lack of competition. The

other type of taxes is called direct taxes, and they're the taxes you're directly responsible for paying. You'll see direct taxes every time you have to pay sales tax or when your paycheck has taxes taken out. This is called income tax.

3. Explain the difference between direct tax and indirect tax. Direct taxes are paid directly by an individual specifically by income tax or sales tax. Indirect taxes are paid to the government by companies but passed on to consumers through the price of the company's goods or services.

17. Is paying your federal income taxes a progressive or regressive tax? Progressive tax

Procedure Students will read excerpts from the article "What Do Your Taxes Pay For?" found at ramseysolutions.com/taxes/where-does-your-tax-money-go. The excerpts are provided with this activity so students can annotate the article and answer the questions to further reflect on the information for additional lesson enrichment. You may then use this formative assessment to plan as you guide students' understanding of tax money allocations

DIRECTIONS Read and annotate excerpts from the article "What Do Your Taxes Pay For?" Analyze the article and evaluate its points. Then, answer the questions about the article. You may also use the information in the student text to help you answer the questions.

If you're like most folks, the first two questions that pop into your head when you look at your tax return each year are "How much did I make?" and "How much did they take?" Who are "they"? The federal government, of course. And while you grumble about how much Uncle Sam takes out of your paycheck every two weeks, there's another question you might wonder about: What are "they" doing with my tax dollars, anyway? That's a great question . . . especially since the IRS collects around \$3.5 trillion in federal taxes each year paid by hardworking taxpayers like you. That's trillion—with a T! It's time to pull back the curtain and find out where your tax money goes. Basically, there are three main categories that your tax money pays for: 1. Interest on government debt (5%) 2. Mandatory spending, also known as entitlement spending, which is not subject to regular budget review (70%) 3. Discretionary spending, which is spent on programs that Congress must regularly review and set aside for a specific purpose (25%) Pretty broad, right? Let's break it down and see where your money really ends up. Insert Graphic

INTEREST ON GOVERNMENT DEBT The U.S. government is currently more than \$28 trillion in debt—and counting— with a small percentage of your tax dollars going toward paying the interest on that debt. The interest on the national debt, which must be paid by the federal government each year, changes based on two factors—the size of the debt itself and rising and falling interest rates. And since both the national debt and the interest rates on that debt are expected to increase over the next decade, so will the size of our nation's interest payments—which means more of our taxpayer dollars might be used to make those payments.

MANDATORY SPENDING Let's talk entitlements. These are Social Security, Medicare, Medicaid, and Veterans Affairs benefits and services. They're called entitlements because the government takes money out of your paycheck to fund them, so you're entitled to these benefits once you meet certain conditions. This category of spending has gone way up since 1962, and there are two main reasons why. First, there was the introduction of new entitlements such as Medicare

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3332 of 3538

and Medicaid (started in 1965), the earned income tax credit (also known as the EITC, started in 1975), and the child tax credit (1997). Second, the population receiving these benefits has exploded as Baby Boomers enter retirement age, start collecting Social Security benefits, and enroll in Medicare. All of these factors, plus a handful of benefits for our military veterans and COVID-19 relief programs, brought mandatory spending's piece of the pie to more than two-thirds (70%) of the federal budget in 2020. Let's take a look at some of the big pieces.

Social Security

Social Security was created to provide income for retired workers over the age of 65 and accounts for a large chunk of mandatory spending. It's designed to supplement your income when you retire or become disabled. If you were to die before you become eligible, your dependents would receive benefits. The types of people who receive Social Security benefits are: • Retired workers and their families • Disabled workers and their families • Survivors of deceased workers Social Security taxes and benefits are tied to inflation, which means they go up as things get more expensive. Even so, the average Social Security monthly benefit for retirees is only \$1,555 each month. So if you're banking on Social Security to fund your retirement dreams, you're going to want to rethink that plan!

Health Care

There's no way around the fact that health care is expensive—especially when you're in your retirement years or for Americans struggling to get by. That's where Medicare and Medicaid come in.

Medicare is a federal health insurance program that provides coverage for several groups of people, but mainly folks over age 65. Who pays for it? Most of it is on your dime! American taxpayers fund Medicare through a 1.45% payroll tax on all of their earnings and an additional 0.9% tax on earned income over \$200,000 (\$250,000 for married couples). Medicaid is another government-sponsored insurance program that provides health coverage for low-income adults, children, pregnant women, elderly adults and people with disabilities. The federal government splits the cost of Medicaid with state governments, and the states get the better deal—in some cases, Uncle Sam pays 78% of their Medicaid costs. Together, Medicare and Medicaid make up 20% of the government's budget, totaling more than \$1.3 trillion to cover roughly 139 million Americans under both programs.

Veterans Benefits

veterans benefits include disability compensation, burial benefits, pensions, education, job training and rehabilitation, insurance and housing programs. These are the big programs that are funded by mandatory spending. While some of the money for these programs (Social Security and Medicare) comes out of your check automatically, some (including money for veterans benefits) comes from taxes on your earned income and things like capital gains. Plus, more of these benefits for our veterans are covered under discretionary spending. Speaking of which.

DISCRETIONARY SPENDING Discretionary spending is the last piece of the puzzle when it comes to how your tax money is spent. Every year, Congress dukes it out over who gets how much money when they debate spending bills. In other words, these programs are subject to Congress' discretion, meaning they can decide to increase or decrease funding for certain programs as they see fit. Let's take a look at some of the major categories covered under discretionary spending.

National Defense

Defense spending usually accounts for about half of all discretionary spending, which funds the Department of Defense and all of its operations.

Transportation

Transportation pays for roads and bridges, air traffic control and the Department of Transportation. We have to get around in our planes, trains and automobiles somehow!

Education

These funds mainly go through the Department of Education and cover everything from paying teachers' salaries to funding grants to pay for college. Unfortunately, this also includes funding for federal student loans. Womp, womp.

Veterans Benefits While some veterans benefits are mandatory expenditures, almost half of the Veterans Administration (VA) budget comes from discretionary funds set aside by Congress. This covers things like medical care, construction of VA facilities, and IT services at those facilities.

Health Some discretionary spending goes to fund agencies like the Centers for Disease Control (CDC), the Food and Drug Administration (FDA), and the National Institute of Health (NIH). These agencies research diseases and new drug therapies, oversee food safety, and fund medical research.

1. What is mandatory spending? What are entitlements? Mandatory spending includes Social Security, Medicare, Medicaid, and Veterans Affairs benefits and services. These are entitlements and are called that because “the government takes money out of your paycheck to fund them, so you’re entitled to them.”
2. Why is there so much mandatory spending in the tax budget? The entitlements that are set in the federal budget continue to cost more and more money because there are more and more people eligible for benefits such as Social Security.
3. At what age does someone qualify to receive Social Security payments? Who gets those Social Security payments? A person qualifies for Social Security after the age of 65. It goes to retired workers and their families, disabled workers and their families, and the survivors of deceased workers.
4. What is the average Social Security monthly payment for a retiree? In your opinion, is that enough to live on? Why or why not? \$1,555. No, it is not enough to live on if you are paying rent or have a mortgage payment and debt. However, if you don’t have any debt and you live in a paid-for house, you might be able to make it work, but it would be hard.
5. Where do you find the Department of Education funding in this tax breakdown? In discretionary spending
6. What is the major difference between mandatory spending and discretionary spending? Mandatory spending includes budget items that must be fulfilled while discretionary spending is items that are funded as far as the money will go.
7. How much of discretionary spending goes toward national defense? About half of discretionary spending is for national defense.
8. Why is deficit spending and the national debt so crucial to pay attention to? The country spends more than it brings in; the national debt is the fastest-growing expense; the 5% of the budget for national debt is just for interest on the debt.
9. If some discretionary funding for veterans benefits was cut, what would be impacted? Some medical care might not be funded, and there might not be enough money for the construction of VA facilities or IT services at the facilities.
10. What is your overall reaction to the tax article? Answers will vary but could include that taxes are very confusing and hard to understand.
11. What additional questions did this article raise for you? Answers will vary.

Earning Limitations

It’s important to note that even though you pay taxes on these mandatory spending programs, everyone varies on whether or not they’re fully eligible to receive these benefits. This is because of earning limitations, which are ultimately based on your income and age. For example, if you choose to take Social Security before you reach the age of 65, you’ll have to make \$21,240 a year or less to be eligible for full Social Security benefits. If you make more than that, your benefit would decrease by \$1 for every \$2 you make over this earning limitation. Once you reach the age of 65, that income threshold is moved to \$56,520 a year.³ For Medicare, anyone is eligible to sign up for the benefit. But if you make over \$97,000 a year, you’ll end up paying more in premium costs.⁴ Medicaid is a little different. Since it’s a joint federal and state-funded program, each state gets to determine the income threshold. However, eligibility is based on the federal poverty level. For a single adult, that level is \$14,580.⁵ The state then gets to choose what percent over the

poverty level the earning limitation will be. Since mandatory spending is 70% of the federal budget, it means your taxes are

The government wants to help small businesses and start-ups thrive because they're a big part of the economy. Small businesses provide millions of jobs and add billions of dollars to the gross domestic product of the U.S.. Because of this, the government might give you money in the form of grants. A grant is a financial gift that's awarded to someone (an individual or a business) that doesn't need to be paid back. Grants can sometimes be hard to find and usually have specific application requirements. But if you have a grant awarded to you, it's free money that you can use to fund your business. Federal, state, and local governments all provide business grants.

Pg 5-7

4. Answers will vary, but students should be able to articulate if there are any requirements to use the resources or if they're free resources.

Original Text: 9. Instruct students to complete this challenge independently. Monitor students' progress and provide support as needed.

- a. Encourage students to drag and drop the sprites to reposition them in the Stage if desired.
 - b. As a challenge, have students click in the textbox of the say block for one of the sprites, delete the text, and type a different message for the sprite to say.
10. If time permits, have students share their stories with one another as they finish.

Updated Text: 9. Instruct students to complete this challenge independently. Monitor students' progress and provide support as needed.

- a. Encourage students to drag and drop the sprites to reposition them in the Stage if desired.
 - b. As a challenge, have students click in the textbox of the say block for one of the sprites, delete the text, and type a different message for the sprite to say.
10. Have students use and/or connect their devices to a projector, smartboard, or another similar device to share their original programs with the class.
- a. Encourage students to explain how they created their projects.

Location: Unit 4, Activity 1, "How Can I Develop an Algorithm to Solve a Problem?" Introduction paragraphs under "Required Materials" and Steps 1-4

Original Text: How Can I Develop an Algorithm to Solve a Problem?

Required Materials

Word processing software

CodeSkulptor3

Google Maps, TikTok, Instagram, and Venmo—these applications took software developers years of trial and error and rounds of debugging to make them what they are today. While a team of software engineers make it look easy, all developers begin learning to program by writing basic computer code. And building programming skills takes practice.

In this activity, you will get practice writing code in Python to develop an algorithm that can solve different problems. Then, you will focus on an algorithm for a specific task to solve a specific problem.

Step 1: Explore CodeSkulptor3

CodeSkulptor3 allows you to develop Python-based code and run a program in its simulated environment. Before you start working with the Python code, you should be familiar with the layout of this website.

Menu

On the left-hand side of CodeSkulptor3's interface, you will find a list of menu options. You may use any or all of these functions while working with in CodeSkulptor3, so take some time to test them and see how they work.

CodeSkulptor3 menu displaying these options: Run, Reset, Save, New URL, Download, Load, Join, Docs, and About.
CodeSkulptor4.

Open a new word processing document and add this heading at the top: CodeSkulptor3's Menu Options.

Below that, set up these subheadings: Run, Reset, Save, New URL, Download, Load, Join, Docs, and About.

Once these headings are set up, explain the purpose of each option as they are used in CodeSkulptor3.

Code

To the right of the menu, in the middle of the screen, there is a window named "Code." This is where you can develop, edit, and run code.

CodeSkulptor3 default coding window with preloaded code.

CodeSkulptor4.

Output

Lastly, on the right-hand side of your screen is a blank window named "Output." This is where a program's output appears when it is run.

Take a moment to explore the preloaded code. Run it to give you an idea of how CodeSkulptor3 works.

Step 2: Revise a String

In this step, you will develop, compare, and improve algorithms for a specific task. You will do this by revising some code to create new output that is all your own! Start by doing the following:

Delete the default code from CodeSkulptor3's coding window.

Copy and paste the code below into the coding window.

```
print("What's up, everybody!?")
```

Next, insert revise the text inside of the quotation marks to read whatever you want!

Note: If you receive a syntax error message when you run this code, double check the quotation marks or apostrophe. Be careful to revise only what you see within quotation marks.

Once your code runs as expected, do two things:

Generate a new URL for the revised code (see Step 1 for a reminder about how to do this)

Take a screenshot of your output window

You'll need to submit both later.

Step 3: Ask for Input and Make an Assignment

Now that you're starting to get the hang of it, we'll add two new elements: an input and assignment. These will help you to develop, compare, and improve algorithms to solve a problem. While the program below only includes two lines of code, you need to make sure that the output generated answers the particular question asked.

Type the following algorithm into CodeSkulptor3 and see what happens:

```
name = input("What is your name?\n")
print ("Hi, " + name + ".")
```

How did it look? The following is an example of what you should see once you run the program.

CodeSkulptor3 dialog box prompting the user with the question, “What is your name?”

CodeSkulptor4.

After you type your name and click Enter, you should see a greeting in the output window. Simple, right?

Now it’s your turn! Just as you revised a string in the previous step, in this step you will revise the question prompt, anticipate the response, and print a message in the output window.

If your code doesn’t run, double check that the spacing and punctuation is still formatted correctly.

Once your code runs successfully:

Generate a new URL for the revised code

Take a screenshot of your output window

You’ll submit both later.

Step 4: Compare Your Code

In this step, you will compare the algorithms you used in the previous two steps.

Recreate the following table in your word processing document.

Look back at the algorithms that you created in Step 2 and Step 3.

Explain how these algorithms are similar to and different from one another.

Updated Text: How Can I Use Loops and Iterations in a TextBased Program?

Required Materials

- Word processing software
- CodeSkulptor3

In the lessons, we learned that loops and iterations are ways to describe an action that repeats. For example, if you’ve ever seen a robotic vacuum, you probably noticed how it operates on its own. That’s because someone programmed the robot to repeat specific actions until either an object is detected or the pattern of the room changes. Although you will not program a vacuum in this activity, you will analyze the benefits of using iteration (code and sequence repetition) in a program. You will also create text-based programs using a software design process and combine control structures, including loops and conditionals, to address real-world situations

Step 1: Practice Using Variables

As with the previous activity, you will be using CodeSkulptor3, so launch it in your browser. You will be working with the code provided below to construct named variables with different data types and perform an operation on the value for each variable. Type the following lines into the coding window of CodeSkulptor3 and run the program:

What happened? If all you see is the number 3 and the name “Scott” below it, then your code works! Now, it’s your turn! Create new values for x and y and then see if your code still runs successfully. In a new word processing document, record the following items to submit later:

- URL to your revised code containing new values for the x and y variables
- Screenshot of the output showing that the program ran successfully,

This is good information to have and to know, but what if we wanted this to become more generalized? Remember that abstraction is simplifying complex problems down to their most basic components by taking away the smaller details. Generalization is ensuring the algorithm can be used in different scenarios.

One way to do this is to modify the existing code to accept user input. The example we used above is a form of hard coding. Hard coding in this scenario assigns specific values to the variables in the code. This does not allow for flexibility in different scenarios. What can we do? If you remember from the lesson, we were able to allow a user to type in their own values using the input and float function. Copy the following code into CodeSkulptor3:

Once you have copied the code, hit run and you will see the input prompt box. Enter a value for x and then a value for y. You will notice that the output box shows the sum of then numbers you have input for x and y. Notice that this makes the algorithm more generalized because you can now work with any number the user inputs!

Step 2: Coding Loops with Words

In this step, you will work with the following new code:

Before you proceed, here are some things you should know about the algorithm:

- There is a list, or array, assigned to the variable "languages."
- Within this array, there are multiple pieces of data that can be referenced. In this case, they are different programming languages.
- The for loop counts how many items are in the list and then assigns them to the item variable. • The loop will continue to assign and print each item in the array until none are left. Now copy, paste, and run the code in CodeSkulptor3 so that you can observe how this loop operates in Python

This hard coding is great, but what if we wanted to generate different lists based on user input? By doing so you will be practicing abstraction by developing a generalized algorithm that can solve different types of problems. In this scenario, your problem is that you need to create different lists based on user input. To do this, copy the following code into CodeSkulptor3:

Run the code as we have in the previous examples and respond to the user input line. In this example, we have stripped down the original code to its bare parts, abstraction, and allowed for multiple different uses associated with creating a list, generalization.

Step 3: Revise a Loop

Are you ready to create your own loop using Python in CodeSkulptor3? Great! Be sure to use the following criteria when creating your loop:

- Develop a list that contains AT LEAST SIX items. You could consider things like sports, days of the week, movies, etc., but feel free to populate your list with your favorite things!
- In your word processing document, record the new URL for your code and take a screenshot of your output to submit later. If you are a beginner with Python, you can use the same code as we used in Step 3. Simply swap out the content to meet the new criteria. For convenience, the code from Step 2 is copied here:

Give it a try! Practice abstraction by developing a generalized algorithm that can solve different types of problems by modifying the code above.

Step 4: Coding Loops with Letters

Now that you've created a loop using six words of your choosing, let's try something new. In this step, you will loop through a word or phrase and individually output each letter on a new line. Start by copying and pasting the code below

into CodeSkulptor3. Don't forget to run the code so that you can see the output.

Now that you have seen how this example works, it's your turn to come up with a word or phrase of your own so that you can create your own loop using letters.

- Copy and paste this code into the coding window of CodeSkulptor3.
- Replace the string "I love to code" with a word or phrase of your own.
- In your word processing document, record the new URL for your code and take a screenshot of your output to submit later

Step 5: Combine Control Structures

Now, you will modify and implement previously written code to develop new and improved programs by working with the if/else statements (also referred to as control structures). In CodeSkulptor3, clear the coding window and copy and paste in the following code:

When you run the program, you'll notice that the output says that the variable "value" is less than the variable "threshold" because 2 is less than 9. Manipulate the code by changing the value of at least one variable so that the output will read "above threshold." Record the following in your word processing document to submit later:

- URL to your revised code
- Screenshot of the output screen after running the program

Original Text: How Can I Save This for Later?

Required Materials

Google Drive (requires login)

Have you ever tried to upload a specific file to a website, only to see a response like this: "Unable to save. Pick a new file type." It can be so frustrating! While websites now accept a wider variety of file types, you still need to understand how to implement independently effective file-management strategies, including file-naming conventions, the use of local and remote locations, and the emergence of digital organization strategies.

Step 1: Create and Organize Folders in Google Drive

The first step in this activity is to create and organize folders in Google Drive. You may already have files and folders from other projects, but you will need a new folder for this activity.

Following this checklist will help you set up your folder structure:

Create a new folder and name it "MSTechApps8_Unit2_Activity3."

In your MSTechApps8_Unit2_Activity3 folder, create three subfolders:

Presentations

Documents

Spreadsheets

In the Presentations folder, create a new Google Slides presentation and name it "Sample Presentation." (No content has to be added to the presentation.)

In the Documents folder, create a new document in Google Docs and name it "Sample Document." (No content has to be

added to the document.)

In the Spreadsheets folder, create a new spreadsheet in Google Sheets and name it "Sample Spreadsheet." (No content has to be added to the spreadsheet.)

Take a screenshot of your eDL folder and its subfolders.

Step 2: Add Content to a File of Your Choice

For this step, you will choose one of the files that you created (and which is still currently empty) and add content to it. You are free to choose the content of the file, but here are some general suggestions that might make this step easier for you:

Suggested File Content

Tool Suggested Idea

Google Docs Journal entry, Notes-Grocery list, Thank-you note for a friend or family member

Google Sheets Checklist-Data, Weather forecast for a city, Basic budget

Google Slides An invitation (to a party or event), Cookbook-Slides for a presentation, Photo album

Step 3: Use Shortcuts to Your Advantage

Employing shortcuts can make life much simpler. Because you are using tools provided by Google Workspace, Google offers its own set of keyboard shortcuts, depending on which operating system (OS) you are using.

From the Google Workspace Learning Center, choose the program that you used to add content to one of your files in Step 2 (Docs, Sheets, or Slides).

Once you make your choice, it will link you to a list of keyboard shortcuts for that program. The example below shows keyboard shortcuts for Google Docs.

Google Docs Keyboard Shortcuts

Common Actions	Windows/Chrome OS	Mac
Copy	Ctrl + C	Cmd + C
Cut	Ctrl + X	Cmd + X
Paste	Ctrl + V	Cmd + V
Paste without formatting	Ctrl + Shift + V	Cmd + Shift + V
Undo	Ctrl + Z	Cmd + Z
Redo	Ctrl + Shift + Z	Cmd + Shift + Z
Insert or edit link	Ctrl + K	Cmd + K
Find	Ctrl + F	Cmd + F

After reviewing the keyboard shortcuts for your chosen program and operating system, record your choice and the use of AT LEAST FIVE shortcuts in your file. Copy the table below to use for your responses (one action has been added as an example of how to complete this table):

File Shortcuts

Action	Keyboard Shortcut	Usage
Copy	Cmd/Ctrl + C	This shortcut was used to copy a section of text within a part of my document.

Once you complete the table, take a screenshot and save it to submit to your instructor.

Step 4: Convert Your File

Sharing your files with other people means making those files available in a format that is freely accessible to others, even if they don't use the same tools you do. Regardless of the file that you created, you will need to convert it into a .PDF file. When working in the Google environment, you can convert a file by clicking on File > Download > PDF Document, as shown below.

Menu options for the process of downloading a document as a .PDF file from Google Docs.
Google Docs™ web-based word-processing program is a product of Google LLC.

Updated Text: Step 1: Create and Organize Folders in Google Drive

The first step in this activity is to create and organize folders in Google Drive. You may already have files and folders from other projects, but you will need a new folder for this activity.

Following this checklist will help you set up your folder structure:

- Create a new folder and name it “MSTechApps8_Unit2_Activity3.”
- In your MSTechApps8_Unit2_Activity3 folder, create three subfolders:
 - Presentations
 - Documents
 - Spreadsheets
- Now let’s name and tag our folders. In the Presentations folder, create a new Google Slides presentation and name it “Sample Presentation.” (No content has to be added to the presentation.)
 - o Tag this file as “Presentation .”.
- In the Documents folder, create a new document in Google Docs and name it “Sample Document.” (No content has to be added to the document.)
 - o Tag this file as “Document.”.
- In the Spreadsheets folder, create a new spreadsheet in Google Sheets and name it “Sample Spreadsheet.” (No content has to be added to the spreadsheet.)
 - o Tag this file as “Spreadsheet.”.
- In the Presentations folder, create a new Google Slides presentation and name it “Sample Presentation.” (No content has to be added to the presentation.)
- In the Documents folder, create a new document in Google Docs and name it “Sample Document.” (No content has to be added to the document.)
- In the Spreadsheets folder, create a new spreadsheet in Google Sheets and name it “Sample Spreadsheet.” (No content has to be added to the spreadsheet.)

Take a screenshot of your eDL folder and its subfolders.

Step 2: Add Content to a File of Your Choice

For this step, you will choose one of the files that you created (and which is still currently empty) and add content to it. You are free to choose the content of the file, but here are some general suggestions that might make this step easier for you:

[...]

Step 4: Convert Your File

Sharing your files with other people means making those files available in a format that is freely accessible to others, even if they don’t use the same tools you do. Regardless of the file that you created, you will need to convert it into a .PDF file. When working in the Google environment, you can convert a file by clicking on File > Download > PDF Document, as shown below.

[...]

Step 5: What to Submit Folder Structure Folder Structure

To practice your new digital organization strategies, you will need to submit the following items in the appropriate hierarchal folder structure:

You will need to submit the following items to your instructor:

- Screenshots:
 - o Top-level folder in the hierarchy named eDL Unit 2 Activity 3 (Step 1)
 - o Subfolders for Presentations, Documents, and Spreadsheets (Step 1)
 - o A .PDF file of the content that you created in Step 2 placed within the subfolders in the hierarchy (Step 3)
- To do so, use what you learned in the lesson to back up the files to Google Drive, Dropbox, or a similar file-

sharing service (preferably the one your school prefers). Once it's backed up in the cloud, share the folder with your instructor.

Becoming sexually active during adolescence carries many risks, such as acquiring a sexually transmitted disease or becoming pregnant. The risk for girls is even greater and includes developing a reproductive tract infection and even cervical cancer. There are many emotional risks, too, with many experiencing such issues as depression, anxiety, and low self-esteem.

Original Text: Code it!

Part 1

Using PythonAnywhere, write a program that meets the following criteria:

Use an appropriate data structure to read in at least 10 integers from the user.

Perform a variety of mathematical operations on the numbers, and print the results of the following:

All the prime numbers

The greatest common divisor between the first and second number

Square of the 3rd number

Square root of the 8th number

The absolute value of the 10th number

Ask the user to input a decimal, round it to 2 decimal places, and then overwrite the 4th number in the list.

Change the 6th number to be the result of the following expression:

The 5th number times the 3rd number divided by the 1st number (use integer division), all added to the 7th number.

Updated Text: Code it!

Part 1

Using PythonAnywhere, write a program that meets the following criteria:

1. Use an appropriate data structure to read in at least 10 integers from the user.

2. Perform a variety of mathematical operations on the numbers, and print the

results of the following:

All the prime numbers

The difference between the first and last number

The greatest common divisor between the first and second number

Square of the 3rd number

Square root of the 8th number

The absolute value of the 10th number

Ask the user to input a decimal, round it to 2 decimal places, and then overwrite

the 4th number in the list.

Change the 6th number to be the result of the following expression:

The 5th number times the 3rd number divided by the 1st number (use integer division),

all added to the 7th number.

Location: Programming 1a, Unit 4, Critical Thinking Question 1

Original Text: Imagine you're troubleshooting a computer with various hardware issues. Based on what you've learned in the unit, identify the component type (Primary Memory, Secondary Memory, CPU, Motherboard, or Peripherals.) that would most likely be the cause of each of the following issues.

You've received a message that you can't download a file due to insufficient storage.

Nothing occurs on the screen when moving or clicking the mouse.

The processing performance of the machine has severely decreased and seems to be reporting high temperatures.

A program has crashed, and error codes reference a memory error or leak.

Answers will vary in description, but should mention the following:

This error has to do with storage, so secondary memory is the culprit.

This could be a peripheral issue with the mouse or the bus it's attached to.

Since memory is referenced, we can assume that the error is related to primary memory or the software itself.

Updated Text: 1. Imagine you're troubleshooting a computer with various hardware issues. Based on

what you've learned in the unit, identify the component type (Primary Memory,

Secondary Memory, CPU, Motherboard, or Peripherals.) that would most likely be the

cause of each of the following issues. Then, describe how that component, if working correctly, should function normally.

A. You've received a message that you can't download a file due to insufficient storage.

B. Nothing occurs on the screen when moving or clicking the mouse.

C. A program has crashed, and error codes reference a memory error or leak.

D. Your computer is making irregular beeping noises and shutting down.

Answers will vary in description, but should mention the following:

This error has to do with storage, so secondary memory is the culprit. Secondary memory is non-volatile and should store data long term.

This is most likely a peripheral issue with the mouse. Peripherals should connect to the CPU through the bus and provide input or output.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Since memory is referenced, we can assume that the error is related to primary memory. Primary memory (RAM) should hold instructions from the software that is currently in use.

This is an issue with the CPU. The central processing unit should interact with RAM to perform the fetch-decode-execute cycle.

Current Page Number(s): 361

Location: Short Answer, 1 through 6 on inset student page

Original Text: 1. Look at the following statement: `numbers = [10, 20, 30, 40, 50]` a. How many elements does the list have? b. What is the index of the first element in the list? c. What is the index of the last element in the list? 2. Look at the following statement: `numbers = [1, 2, 3]` a. What value is stored in `numbers[2]`? b. What value is stored in `numbers[0]`? c. What value is stored in `numbers[-1]`? 3. What will the following code display? `values = [2, 4, 6, 8, 10]`
`print(values[1:3])` 4. What does the following code display? `numbers = [1, 2, 3, 4, 5, 6, 7]`
`print(numbers[5:])` 5. What does the following code display? `numbers = [1, 2, 3, 4, 5, 6, 7, 8]`
`print(numbers[-4:])` 6. What does the following code display?
`values = [2] * 5`
`print(values)`

Updated Text: 1. Look at the following statement: `numbers = [10, 20, 30, 40, 50]` a. Identify the structured data type of the one-dimensional array (list). b. How many elements does the list have? c. What is the index of the first element in the list? d. What is the index of the last element in the list? e. Give an example of how you might use the structured data type to modify the array (list)? 2. Look at the following statement: `numbers = [1, 2, 3]` a. Identify the structured data type of the one-dimensional array (list). b. What value is stored in `numbers[2]`? c. What value is stored in `numbers[0]`? d. What value is stored in `numbers[-1]`? e. Give an example of how you might use the structured data type to modify the array (list)? 3. Identify the structured data type you would use to modify the data in the following one-dimensional array, and then use the structured data type to modify the data. `values = [2, 4, 6, 8, 10]`
`print(values[1:3])` 4. What does the following code display? `numbers = [1, 2, 3, 4, 5, 6, 7]`
`print(numbers[5:])` 5. What does the following code display? `numbers = [1, 2, 3, 4, 5, 6, 7, 8]`
`print(numbers[-4:])` 6. What does the following code display? `values = [2] * 5`
`print(values)`

Page 3391 of 3538

need to be in the same broadcast domain, etc.

In this activity, you'll need to make sure that you've considered what goes into creating the logical map for a network—because you're the network specialist who will be creating the logical map for a small 3-D printing company.

Step 2: What Goes Where?

You need to know the following details:

You are responsible for designing and implementing the network structure for a printing company.

The company hosts proprietary software that provides a web-based interface for users to design models (primarily for board games).

Your company prints these models (using one of 10 3-D printing devices available on site) and ships them to users.

You also sell the digital file created by the software to customers who have their own 3-D printers at home.

Customers can re-download these files at any time.

A customer can access their library of creations at any time (in case the customer wants to reprint a model or take an old model, make changes, and reprint it).

Using a word processing software, image editing software, or a similar software, create a visual map of the logical connections between devices. A device may be represented by an image or a name, but ensure that the device's function is clearly indicated somewhere. (For example, the label "Web Software Server" appears on the map, and in the index or map key, it says, "Web Software Server: Hosts the software that customers use to design their models").

Remember that these sorts of maps are visual tools; the various VLANs and similar structures you propose should be indicated by boxes, circles, etc., that are connected by lines. Your VLANs and other structures should not simply be itemized in a list.

Don't Forget Security

It should go without saying by now, but you should keep security in mind as you design the network!

Your network should include at least the following concepts:

A DMZ

An isolated VLAN

TWO or more broadcast domains

Step 3: What to Submit

Your submission for this activity is a visual, logical map that is focused on VLAN concepts. Your map should depict a network suitable for the 3-D modeling/printing company described above.

Updated Text: Secure Logical Mapping

Required Materials

- Word processing software
- Image editing software (optional)

Step 1: Designing a Secure Network

Before cables are connected to any devices, a network administrator should ensure that they've thought through the security implications of the network. That includes both security in the's logical map and physical security—that is, network administrators need to know which devices are directly connected to others, which ones need to be in the same broadcast domain, how the devices will be secured, where they will be located in an office, etc.

In this activity, you'll need to make sure that you've considered what goes into security and creating the logical map for a network—because you're the network specialist who will be creating the logical map for a small 3-D printing company. You will need to evaluate the role of physical security in your network as well as the role of security in logical mapping. In addition, you will also need to evaluate the role of network security devices such as firewalls, intrusion detection systems (IDS), intrusion prevention systems (IPS), intrusion detection/prevention systems (IDPS), and security information and event management (SIEM) systems.

Step 2: What Goes Where?

You need to know the following details:

- You are responsible for designing and implementing the network structure for a printing company.
- The company hosts proprietary software that provides a web-based interface for users to design models (primarily for board games).
- Your company prints these models (using one of 10 3-D printing devices available on site) and ships them to users.
- You also sell the digital file created by the software to customers who have their own 3-D printers at home.
- Customers can re-download these files at any time.
- A customer can access their library of creations at any time (in case the customer wants to reprint a model or take an old model, make changes, and reprint it).

Using a word processing software, image editing software, or a similar software, create a visual map of the logical connections between devices. A device may be represented by an image or a name, but ensure that the device's function is clearly indicated somewhere. (For example, the label "Web Software Server" appears on the map, and in the index or map key, it says, "Web Software Server: Hosts the software that customers use to design their models").

Remember that these sorts of maps are visual tools; the various VLANs and similar structures you propose should be indicated by boxes, circles, etc., that are connected by lines. Physical security can be indicated through symbols for locked doors, security cameras, etc. Your VLANs and other structures should not simply be itemized in a list.

Don't Forget Security

It should go without saying by now, but you should keep security in mind as you design the network!

Your network should include at least the following concepts:

- A DMZ
- An isolated VLAN
- TWO or more broadcast domains
- Network security devices (firewalls, IDS, IPS, IDPS, or SIEM)
- Physical security for network devices

Step 3: What to Submit

Your submission for this activity is a visual, logical map that is focused on VLAN concepts as well as physical security. Your map should depict a network suitable for the 3-D modeling/printing company described above.

Original Text: In your own words, explain what cloud computing means, including at least one example of the use of the cloud. What are the benefits and drawbacks of typical cloud services?

Explain the difference between any TWO of the following cloud services:

Platform as a service (PaaS)

Software as a service (SaaS)

Infrastructure as a service (IaaS)

Your analysis should include the strengths and drawbacks of the two types of cloud services you choose.

Think of a place that could make use of a cloud computing environment. This could be a school, home, business—anything! Would a public cloud, private cloud, hybrid cloud, or community cloud be best for that place? In your answer, describe the cloud type you chose and why it would be best.

Describe a situation in which someone might come in contact with an application interface (API). In your answer, explain what an API is.

In what ways is software-defined networking (SDN) similar to traditional networking? In what ways is it different (or what is a new, distinct challenge it poses)? In your answer, define what SDN is.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3395 of 3538

Location: Under Crime scene investigators (CSIs)

Original Text: A crime scene investigator is typically an individual supported by the local law enforcement who, for the most part, carries out tasks at the crime scene. These tasks may include the search of a crime scene, and the collection and preservation of physical evidence. They do not, however, take part in any analysis of evidence or the actual capturing of a criminal, their work is solely focused on the scene of the crime.

Updated Text: A crime scene investigator is typically an individual supported by the local law enforcement who, for the most part, carries out tasks at the crime scene. These tasks may include the search of a crime scene, and the collection and preservation of physical evidence. Depending on the size of the department, a CSI can complete crime scene analysis such as fingerprints and phones. It is not usual for a CSI to be involved in DNA or trace analysis. CSIs can also be certified for bloodstain pattern analyst work (analyzing blood stain patterns and blood evidence).

As an activity, create a job description document to show what a CSI does. Swap with another student and critique one another's work. Work together to create a summary of requirements for a CSI, including collegiate course requirements, licensure, certifications, and physical and mental capabilities.

Location: Under Crime scene investigators (CSIs)

Original Text: A CSI will also take on smaller tasks if there is a lack of officers on scene, for example by recording and documenting the scene through photography, taking a suspect's prints, and dusting for impression evidence.

Updated Text: A CSI will prioritize taking photos of the scene whether they are from a small or large department. CSIs may also participate in fingerprint analysis depending on the size of their department. A detective can also take photos at a crime scene. It is important to recognize that, if a victim does not die at a scene, then Patrol Officers may take pictures of a crime scene. If the victim does die on the scene, they will definitely take pictures at a crime scene. This is also true for a scene involving a serious substantially violent assault, for example, that of a child. In this situation, a CSI will be assigned to the scene and pictures of the scene are their number one priority.

Original Text: Threats, Vulnerabilities, and Exploits

The electronic systems that we use today are all accompanied by some form of risk. Not only could a device fail at a most inopportune time, but it could also leak information about us, or an adversary may find a way to break into our network. What are these risks? How can we mitigate or minimize our exposure to them?

Let's take a look at some risks our networks face each day. First, let's talk about threats. A threat to our networks refers to anything that has the potential to harm our systems. System vulnerabilities represent significant threats to modern-

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3400 of 3538

day networks. Two of the most common risks of this type are malware and social engineering attacks. Malware includes threats such as Trojan horses, viruses, and computer worms that can become installed on your computer. Social engineering attacks attempt to trick you into providing personal information such as usernames and passwords. You will learn more about these risks, and others, later in the course.

A vulnerability is something in a system or network that is easily attacked. The most common vulnerability is an unpatched operating system (Windows, Linux, Android, Apple, etc.) that allows an attacker to attack and access a network easily. We call this an exploit, or taking advantage of the vulnerability. As you research the topic of network security, you will read about countless attacks that were caused by the exploitation of vulnerabilities.

For example, imagine you are hired to manage a network for an organization. On your first day, you notice all client computers are running Windows XP as their operating system. You know that Microsoft ended support for Windows XP on April 8, 2014, recommending that everyone upgrade their systems immediately. You also know that the CVE (Common Vulnerabilities and Exposures) database lists 741 known security exploits for Windows XP. This organization is at extreme risk of a vulnerable Windows XP system being attacked and exploited.

Updated Text: Threats, Vulnerabilities, and Exploits

The electronic systems that we use today are all accompanied by some form of risk. Not only could a device fail at a most inopportune time, but it could also leak information about us, or an adversary may find a way to break into our network. What are these risks? How can we mitigate or minimize our exposure to them?

Let's take a look at some risks our networks face each day. First, let's talk about threats. A threat to our networks refers to anything that has the potential to harm our systems. System vulnerabilities represent significant threats to modern-day networks. Two of the most common risks of this type are malware and social engineering attacks. Malware includes threats such as Trojan horses, viruses, and computer worms that can become installed on your computer. Social engineering attacks attempt to trick you into providing personal information such as usernames and passwords. You will learn more about these risks, and others, later in the course.

To better understand these risks, we can use industry-accepted metrics like the Common Vulnerability Scoring System (CVSS). CVSS provides an open framework for communicating the characteristics and impacts of IT vulnerabilities. For example, malware such as a Trojan horse might have a high CVSS score due to its ability to control the host computer, while a social engineering attack might have a lower score, but its impact could be severe depending on the sensitivity of the information revealed. By comparing these CVSS scores, we can prioritize which vulnerabilities to address first.

A vulnerability is something in a system or network that is easily attacked. The most common vulnerability is an unpatched operating system (Windows, Linux, Android, Apple, etc.) that allows an attacker to attack and access a network easily. We call this an exploit, or taking advantage of the vulnerability. As you research the topic of network security, you will read about countless attacks that were caused by the exploitation of vulnerabilities.

For example, imagine you are hired to manage a network for an organization. On your first day, you notice all client computers are running Windows XP as their operating system. You know that Microsoft ended support for Windows XP on April 8, 2014, recommending that everyone upgrade their systems immediately. You also know that the CVE (Common Vulnerabilities and Exposures) database lists 741 known security exploits for Windows XP. This organization is at extreme risk of a vulnerable Windows XP system being attacked and exploited.

Original Text: How Vulnerable Is Your School?

In this activity, you will perform a high-level risk assessment of your school or a similar educational institution.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3401 of 3538

Consider a typical high school, either one you attend or one near you. Imagine the school has asked you to help assess its information security plan.

Your first task is to lay out the attack surface for the school. Consider the physical grounds, information systems, and data needs, including both digital and hard copies of information. What are the school's vulnerabilities? Create a slideshow presentation to discuss the following potential attack vectors:

Hardware
Software
Network
Human
Physical
Organizational

You will find it helpful to research other sample analyses of attack surfaces to find out more about each vector. For each of those vectors, start with a slide describing the category of vulnerability. For example, what do you mean when you say you will discuss a "hardware," "software," or "human" vulnerability? Identify potential risks to the school or institution that come with each category. This should be accessible to a broad audience as you will be presenting this material to educators and administrators who may not be as tech-savvy as you!

Next, create one or two slides detailing the specific vulnerabilities that should be considered in conjunction with that category of attack (or hypothetical vulnerabilities, if you don't have true access to the information required). What are the warning signs or alerts which may accompany those vulnerabilities? Remember that you are only discussing something that could be exploited by a bad actor, not proposing solutions (yet).

Your submission for this activity will be a slideshow-style presentation on the attack surface for a school by describing each attack vector in one to three slides.

Updated Text: How Vulnerable Is Your School?

In this activity, you will perform a high-level risk assessment of your school or a similar educational institution.

Consider a typical high school, either one you attend or one near you. Imagine the school has asked you to help assess its information security plan.

Your first task is to lay out the attack surface for the school. Consider the physical grounds, information systems, and data needs, including both digital and hard copies of information. What are the school's vulnerabilities? Create a slideshow presentation to discuss the following potential attack vectors:

- Hardware
- Software
- Network
- Human
- Physical
- Organizational

You will find it helpful to research other sample analyses of attack surfaces to find out more about each vector. For each of those vectors, start with a slide describing the category of vulnerability. For example, what do you mean when you say you will discuss a "hardware," "software," or "human" vulnerability? Identify potential risks to the school or institution that come with each category. This should be accessible to a broad audience as you will be presenting this material to educators and administrators who may not be as tech-savvy as you!

Next, create one or two slides detailing the specific vulnerabilities that should be considered in conjunction with that category of attack (or hypothetical vulnerabilities, if you don't have true access to the information required). What are the warning signs or alerts which may accompany those vulnerabilities? Remember that you are only discussing something that could be exploited by a bad actor, not proposing solutions (yet).

One vulnerability you should consider is that of a possible payload. First, describe what a payload is in terms of cybersecurity and provide a probable scenario in which a payload could enter the school's system given the current security measures.

Your submission for this activity will be a slideshow-style presentation on the attack surface for a school by describing each attack vector in one to three slides.

Original Text: Protecting the Triad: Preventative Measures

In this activity, you will create a basic security plan for a small, fictional company that deals with sensitive information.

Imagine that you are a cybersecurity consultant who has recently been hired by a small company that issues free bail bond loans to qualifying clients. They want to protect their sensitive client information.

What's bail and how do bail bonds work? Let's look at the bail concept first.

When the police make an arrest, the court system determines whether the person who was arrested (the defendant) can wait for their court date from home, or whether they will remain in jail based on a number of factors. If the defendant is allowed to wait from home, the court system asks them to post bail, or make a payment, for a certain amount of money as a form of motivation to return to court for the trial. The bail amount is returned to the defendant after they appear in court, and the case has been resolved. If the defendant is offered the bail option but can't afford it, they remain imprisoned until their trial, unable to work or attend to any familial responsibilities.

Bail bond companies are entities that pay the bail for a defendant in return for an interest rate on the bail amount, so in the end, the person who was arrested will have to pay for bail and an additional percentage based on their interest rate and how long it takes them to complete their payments.

The goal of this bail bond company is to offer FREE loans to defendants who are likely to be able to pay their bail bond in full over time. In order to determine which defendants are most likely to pay, this company collects highly sensitive information about their clients and is very concerned about securing its data. The company collects data by several means: forms completed in person, which are later digitized; web interfaces; and investigation by staff members, whose notes are sent securely to the main server.

The company has asked you about what it should do to protect the privacy and security of its clients' information. You need to put together a presentation that clearly explains the three security concepts that form the CIA triad (i.e., confidentiality, integrity, and availability).

The presentation should also highlight AT LEAST FIVE of the following security measures:

Encryption

Steganography

Access control

Hashing

Digital signatures and certificates

Redundancy and fault tolerance

Importance of patching

Create a video or audio file of you delivering the presentation to the company's staff. The presentation should be 5 to 7 minutes long and appropriate for an audience that possesses only a basic understanding of computers and the internet. If you choose to create a video recording, you may supplement your presentation with a slideshow-style presentation if you'd like. If you deliver your presentation entirely by audio recording, you may find it helpful to prepare a script beforehand.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Your presentation should be tailored to the data and security needs of this specific company. Your five chosen security measures should clearly cover the three components of the CIA triad: confidentiality, integrity, and availability.

Your submission for this activity will be the audio or video file containing your presentation.

Updated Text: Protecting the Triad: Preventative Measures

In this activity, you will create a basic security plan for a small, fictional company that handles sensitive information. Cybersecurity deals with protecting computer systems, networks, data, and digital information from cyberattacks and malicious intent. Information security is similar but is concerned with protecting information, especially electronic data, from unauthorized use. Imagine that you are a cybersecurity consultant who has recently been hired by a small company that issues free bail bond loans to qualifying clients. The company wants to protect its sensitive client information.

What's bail, and how do bail bonds work? Let's look at the bail concept first.

When the police make an arrest, the court system determines whether the person who was arrested (the defendant) can wait for their court date from home or whether they will remain in jail. The decision is based on a number of factors. If the defendant is allowed to wait from home, the court system asks them to post bail, or make a payment, for a certain amount of money as a form of motivation to return to court for the trial. The bail amount is returned to the defendant after they appear in court and the case has been resolved. If the defendant is offered the bail option but can't afford it, they remain imprisoned until their trial, unable to work or attend to any familial responsibilities.

A bail bond company pays the bail for a defendant in return for an interest rate on the bail amount, so in the end, the person who was arrested will have to pay bail and an additional percentage based on their interest rate and how long it takes them to complete their payments.

The goal of this bail bond company is to offer FREE loans to defendants who are likely to be able to pay their bail bonds in full over time. In order to determine which defendants are the most likely to pay, this company collects highly sensitive information about its clients and is very concerned about securing its data. The company collects data through several means: forms completed in person, which are later digitized; web interfaces; and investigation by staff members, whose notes are sent securely to the main server.

The company has asked you about what it should do to protect the privacy and security of its clients' information. You need to put together a presentation that clearly explains the three security concepts that form the CIA triad (i.e., confidentiality, integrity, and availability). In your presentation, be sure to define the terms "cybersecurity" and "information security" in your own words.

The presentation should also highlight AT LEAST FIVE of the following security measures:

- Encryption
- Steganography
- Access control
- Hashing
- Digital signatures and certificates
- Redundancy and fault tolerance
- Importance of patching

Create a video or audio file of yourself delivering the presentation to the company's staff. The presentation should be five to seven minutes long and appropriate for an audience that possesses only a basic understanding of computers and the internet. If you choose to create a video recording, you may supplement your presentation with a slideshow-style presentation if you'd like. If you deliver your presentation entirely via an audio recording, you may find it helpful to prepare a script beforehand.

Your presentation should be tailored to the data and security needs of this specific company. Your five chosen security measures should clearly cover the three components of the CIA triad: confidentiality, integrity, and availability.

Your submission for this activity will be the audio or video file containing your presentation.

Location: Network Security Fundamentals 1a, Unit 4, Lesson 3

Original Text: Ports, Protocols, and Services
IP Services and Ports

Your next step takes you a little deeper into the topic of how devices on a network talk to each other. We know the OSI has layers that help to define how networks function. You learned about address types on layer 2 (MAC) and layer 3 (IP). You also know that there are two layer 4 transport protocols (TCP, UDP) that move data around and that there are two versions of the IP protocol (v4 and v6) that could be in use on our network. After all of that, how could there possibly be more? Well, now, we need to talk about IP ports, protocols, and services.

We have used the term protocol before, so you know that it represents a communications standard. IP ports are part of that communication standard. Much as a MAC address and an IP address identify a node on a network, ports define the service that our node uses and the protocol that is responsible for transporting the data. For example, when we access our favorite website, we use two services. Most websites use the HTTP and HTTPS services transported by the TCP protocol. HTTP is the Hypertext Transfer Protocol, which is the protocol that webpage or website data is transmitted over. HTTPS is the secure, or encrypted, version of HTTP, and it securely delivers webpage content.

In the past, you have no doubt looked at website URLs in your favorite browser and seen HTTP and HTTPS many times, but you may not have known what they were. These tell your web browser how that web page data will be received and transmitted to your device and, ultimately, your screen. HTTPS has predominantly become the standard for all website traffic now to ensure data privacy. If you notice a website to be only HTTP, you should never enter personal or financial data on that website because it is not encrypted and could be intercepted by anyone on the internet.

Two web browser windows are shown. In one window, the address <https://www.netban2k.com> has a red circled “i” icon next to it, and a large circled “i” icon is below it with the message “Your connection is not secure.” The other window has the address <https://www.netbanks.com> with a green lock icon next to it and a large green circled check mark below it with the message “Secure connection”.

Every website should use HTTPS to improve search rankings and to avoid being labeled as not secure.

Each service is assigned a port number, and every IP address has 65,536 ports associated with it ranging from 0 to 65,535. That sounds like a daunting number and a lot to remember. However, you will begin to learn and memorize the common port numbers very quickly the more you study networking, and as you begin to configure equipment, the numbers will become more and more familiar. In the example above, HTTP would have been assigned port 80 and HTTPS port 443. When we refer to a port number with an IP address, we add a colon (:) to the end of the IP address and then the port number. For example, 192.168.1.50:443 indicates that the node is running an application communicating via HTTPS. Routers and firewalls really care about the IP port that the service runs on. Both make traffic decisions based on the service and port number. The firewalls that we learned about in an earlier unit are configured to allow or deny network traffic based on the port, and if they are advanced enough, they can open the packet and look for the actual service type. This gives network administrators granular control over the type of traffic that can enter or leave their networks. As you may have already realized, IP ports and services could be a large part of an organization’s attack surface, too.

There is a structure to IP ports that makes learning about them a little more manageable. iSCSI: TCP Ports 860, 3260
Internet Small Computer Systems Interface (iSCSI) is an important protocol in data centers that allows systems to access data storage devices that are connected to the network. In data centers, servers connect to large network-connected storage arrays. iSCSI has become a standard for connecting to network-attached storage and can be connected to the network via copper or fiber.

Fibre Channel: TCP Port 3225

Fibre Channel is a more complex, scalable, and expensive solution than iSCSI. The protocol is typically found in very large

Proclamation 2024: Report of Editorial Changes (11/08/2023)

and complex data centers. As the name implies, in Fibre Channel, all the connections are made via fiber optic cable. Data transfer speeds are much faster than in iSCSI.

IP Services and Ports

Your next step takes you a little deeper into the topic of how devices on a network talk to each other. We know the OSI has layers that help to define how networks function. You learned about address types on layer 2 (MAC) and layer 3 (IP). You also know that there are two layer 4 transport protocols (TCP, UDP) that move data around and that there are two versions of the IP protocol (v4 and v6) that could be in use on our network. After all of that, how could there possibly be more? Well, now, we need to talk about IP ports, protocols, and services.

We have used the term protocol before, so you know that it represents a communications standard. IP ports are part of that communication standard. Much as a MAC address and an IP address identify a node on a network, ports define the service that our node uses and the protocol that is responsible for transporting the data. For example, when we access our favorite website, we use two services. Most websites use the HTTP and HTTPS services transported by the TCP protocol. HTTP is the Hypertext Transfer Protocol, which is the protocol that webpage or website data is transmitted over. HTTPS is the secure, or encrypted, version of HTTP, and it securely delivers webpage content.

In the past, you have no doubt looked at website URLs in your favorite browser and seen HTTP and HTTPS many times, but you may not have known what they were. These tell your web browser how that web page data will be received and transmitted to your device and, ultimately, your screen. HTTPS has predominantly become the standard for all website traffic now to ensure data privacy. If you notice a website to be only HTTP, you should never enter personal or financial data on that website because it is not encrypted and could be intercepted by anyone on the internet. Each service is assigned a port number, and every IP address has 65,536 ports associated with it ranging from 0 to 65,535. That sounds like a daunting number and a lot to remember. However, you will begin to learn and memorize the common port numbers very quickly the more you study networking, and as you begin to configure equipment, the numbers will become more and more familiar. In the example above, HTTP would have been assigned port 80 and HTTPS port 443. When we refer to a port number with an IP address, we add a colon (:) to the end of the IP address and then the port number. For example, 192.168.1.50:443 indicates that the node is running an application communicating via HTTPS.

Routers and firewalls really care about the IP port that the service runs on. Both make traffic decisions based on the service and port number. The firewalls that we learned about in an earlier unit are configured to allow or deny network traffic based on the port, and if they are advanced enough, they can open the packet and look for the actual service type. This gives network administrators granular control over the type of traffic that can enter or leave their networks. As you may have already realized, IP ports and services could be a large part of an organization's attack surface, too. To effectively manage this, network administrators use common tools for monitoring ports such as 'Wireshark' for packet analysis, 'nmap' for network scanning, and 'Netstat' for viewing active network connections. These tools provide valuable insights into the data transmitted through each port and help in identifying potential security risks.

iSCSI: TCP Ports 860, 3260

Internet Small Computer Systems Interface (iSCSI) is an important protocol in data centers that allows systems to access data storage devices that are connected to the network. In data centers, servers connect to large network-connected storage arrays. iSCSI has become a standard for connecting to network-attached storage and can be connected to the network via copper or fiber. For monitoring iSCSI traffic on TCP Ports 860, 3260, network administrators typically use tools such as 'iSCSI Enterprise Target' which allows a machine to share storage over a network. These tools assist in detecting any anomalies or potential threats within the network, thereby enhancing overall network security.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Fibre Channel: TCP Port 3225

Fibre Channel is a more complex, scalable, and expensive solution than iSCSI. The protocol is typically found in very large and complex data centers. As the name implies, in Fibre Channel, all the connections are made via fiber optic cable. Data transfer speeds are much faster than in iSCSI. In order to monitor Fibre Channel traffic on TCP Port 3225, network administrators can utilize specialized tools such as 'Wireshark' with its FC protocol dissector, allowing for in-depth analysis of Fibre Channel data and understanding network behavior. These monitoring tools provide visibility into data transmission and are critical in maintaining robust network security.

Location: Network Security Fundamentals 1a, Unit 4, Critical Thinking Questions 2 and 5

Original Text: Identify the number and purpose of any two well-known ports (such as SSH, HTTP, or HTTPS).

Answers will vary, and there are hundreds of possible answers, but here is an example: HTTP is assigned to port 80 and stands for HyperText Transfer Protocol; it transmits webpage data. HTTPS, the secure/encrypted version, uses port 443. Identify at least two similarities and two differences between the OSI model and the TCP/IP model.

Answers will vary. Both function similarly as abstractions of network communications into "layers" where certain processes occur. Both share the transport layer, which has a similar function for each (though different numbers). Both must be memorized for people who wish to complete CompTIA Network+ certification. As for differences, the first layer (network access) of the TCP model covers the first two layers of the OSI model. Similarly, the application layer (2) for the TCP model merges the final three layers of the OSI model. The TCP model covers a more limited set of circumstances and protocols.

Updated Text: 2. Identify the number and purpose of any two well-known ports (such as SSH, HTTP, or HTTPS).

Additionally, name a common tool that can be used to monitor these ports and briefly describe how it works.

Answers will vary, and there are hundreds of possible answers, but here is an example: HTTP is assigned to port 80 and stands for HyperText Transfer Protocol; it transmits webpage data. HTTPS, the secure/encrypted version, uses port 443.

Wireshark is a common tool used to monitor these ports. It captures and analyzes network packets, providing valuable insight into the data transmitted through these ports.

5. Identify at least two similarities and two differences between the OSI model and the TCP/IP model. Also, discuss how port monitoring tools can be used in the context of these models to enhance network security.

Answers will vary. Both function similarly as abstractions of network communications into "layers" where certain processes occur. Both share the transport layer, which has a similar function for each (though different numbers). Both must be memorized for people who wish to complete CompTIA Network+ certification. As for differences, the first layer (network access) of the TCP model covers the first two layers of the OSI model. Similarly, the application layer (2) for the TCP model merges the final three layers of the OSI model. The TCP model covers a more limited set of circumstances and

protocols. In terms of port monitoring tools, they interact mainly with the transport layer of both models, where port numbers are defined. For example, 'nmap' scans for open ports and identifies the protocols being used, which can help detect any potential security vulnerabilities.

Original Text: Heuristics and RATs

Watch “The 1s and 0s Behind Cyber Warfare,” a TED Talk given by Chris Domas.

Then, watch “What You Need to Know About Stalkerware,” a TED Talk given by Eva Galperin.

Based on your viewing of these two videos, answer the following questions:

Chris Domas makes a comment about being able to recognize quickly that particular patterns of binary code represent different data types. How does this relate to the operation of detection methods that rely on the ability to match signatures through the use of heuristics?

What does Eva Galperin mean when she talks about “account compromise,” and how does two-factor authentication help prevent that sort of unauthorized access? What other sort of detection system could help to prevent or at least alert the account owner about this kind of access?

Why were so many virus scan programs unable to recognize RAT as being malicious?

Do you think there’s any way for a private citizen to use RAT ethically? Do you think there’s any way for a government to use RAT ethically?

Updated Text: Heuristics and RATs

Watch “The 1s and 0s Behind Cyber Warfare,” a TED Talk given by Chris Domas.

Then, watch “What You Need to Know About Stalkerware,” a TED Talk given by Eva Galperin.

Based on your viewing of these two videos, answer the following questions:

1. Chris Domas makes a comment about being able to recognize quickly that particular patterns of binary code represent different data types. How does this relate to the operation of detection methods that rely on the ability to match signatures through the use of heuristics?

Answers will vary. Domas realizes that converting patterns of binary code into something “recognizable” (as in the case of an address book, for example) speeds up his analyses. Similarly, an IPS or IDS that sees specific patterns in code should be able to identify certain patterns quickly as being similar to known attacks even if the signature isn’t 100-percent identical to a known threat.

2. What does Eva Galperin mean when she talks about “account compromise,” and how does two-factor authentication help prevent that sort of unauthorized access? What other sort of detection system could help to prevent or at least alert the account owner about this kind of access?

An account is compromised when someone has the correct password to access it but does not have permission from the account owner to use the password. With two-factor authentication, as long as the account owner is the sole physical owner of the second device, the account is kept secure.

As for other detection systems, basically, any anomaly detection system (or some rules-based detection systems) would work. The video uses the example of logging the location of the last person to access the account and flagging unusual locations.

3. Why were so many virus scan programs unable to recognize RAT as being malicious?

Answers will vary, but students might note that the programs were installed legitimately, so they weren't flagged. Alternatively, students might say that they just weren't entered into the signature database or the blacklist for these programs because they didn't realize they were being used in nefarious ways.

4. Considering the ethical principles of privacy and consent, do you think there's any way for a private citizen to use RAT ethically? Do you think there's any way for a government to use RAT ethically?

Answers will vary. While RAT is most often used in a controlling way, students might make a case for limited RAT use by parents for their children's devices as a condition for being allowed to use a smartphone. Or students might say that no private citizen should ever be allowed that level of access. When it comes to the government, students may believe that RAT can be used ethically in controlled investigations in which the authorities have been granted a warrant. Or students may argue that the technology is too easy to abuse for the government ever to be able to use it ethically. The ethical considerations here pivot around the principles of privacy and consent. The use of RAT, by private citizens or government entities, raises questions about how far one's rights to privacy can be intruded upon and when, if ever, such intrusions could be considered ethical.

Location: Network Security Fundamentals 1a, Unit 6, Discussion Question 1

Original Text: Wikileaks is a well-known website that releases document caches that have been gathered by hackers—for example, the manual of operations for the infamous U.S. prison in Guantanamo Bay and documents from the Democratic National Committee. Explain whether the individuals who supply information to Wikileaks would generally be considered white-hat, black-hat, or gray-hat hackers based on their motivation. Then, evaluate the ethics of hacking a site and revealing the information on it. Discuss how the culture of black-, white-, or gray-hat hacking might influence the site contributor's decisions. Finally, explore the possible outcomes of the actions of sites like Wikileaks in terms of the social impact and legal liability.

Answers will vary. These hackers are absolutely not white-hat hackers. From a purely cybersecurity-based definition, they ought to be called black-hat hackers because they are not sharing information (generally) to prove a site is not being defended properly; they are sharing information that the owners of the data did not intend to share. However, students may attempt to make the argument that the hackers are acting "in the public good" by trying to share information that the public needs to know.

Similarly, ethically speaking, Wikileaks releases information on a selective basis to achieve partisan and selfish ends—that is, for its owners and contributors—but students who only know the organization in passing may make good-faith arguments that some organizations commit atrocities worthy of being released, as in the torture committed at Guantanamo Bay. Similarly, an "information should be free" culture common to gray-hat hacking communities contributes to behavior that is ultimately unethical and illegal but seems morally sound to its contributors.

Legally, Wikileaks contributors are clearly committing crimes, but prosecuting them is difficult. In terms of outcomes, students will have different evaluations based on their knowledge of the site. Ideally, students should recognize that releasing information is not a neutral practice and that bad actors generally try to do so to achieve their own ends (e.g., advancing propaganda), but more idealistic students may have more optimistic takes.

Original Text: Metasploit

The most common tool to show up in your search results will likely be the Metasploit Framework. First released in 2003, this tool is a popular choice among both white hat and black hat hackers because it is robust and easy to use. The software has been adapted to run on Windows and Linux operating systems. Metasploit has brought point-and-click functionality to scanning, testing, and exploiting common network as well as software vulnerabilities.

A screenshot of the Metasploit framework shows the Metasploit logo, a white M on a blue background, and the following text: "http://metasploit.pro", "metasploit v4.12.8-dev", "1551 exploits - 898 auxiliary - 267 post", "438 payloads - 38 encoders - 8 nops", and "Free Metasploit Pro trial: http://r-7.co/trymsp".

Screenshot from Metasploit Framework by 4shadoww. Distributed under the CC BY-SA 4.0 license.

For white hats, Metasploit is a penetration testing tool, meaning it can be used to test the security readiness of a network and its systems. If and when the tool finds a vulnerability, the network admin can remediate the issue. To a black hat, Metasploit represents an attack tool that will identify a vulnerability and automatically proceed with the exploitation of that system flaw by delivering a malicious payload. Think of this software tool as being like a hammer. In the hands of a master builder, it can be used to create fantastic structures; in the hands of a bad actor, it can be used to wreak havoc and destruction.

Consider this example: A network admin runs a Metasploit scan on the company network as a routine security practice while looking for vulnerabilities. During the scan, a Windows XP client is discovered to be online. The admin is distraught about this discovery because, as you already know, Windows XP has been officially retired since 2009 and is extremely vulnerable to exploitation. This allows the admin to take immediate action before a bad actor can launch an attack against that client.

software has been adapted to run on the Windows and Linux operating systems. Metasploit has brought point-and-click functionality to scanning, testing, and exploiting common network and software vulnerabilities.

Screenshot from Metasploit framework by 4shadoww. Distributed under the CC BY-SA 4.0 license.

For white hats, Metasploit is a penetration testing tool, meaning it can be used to test the security readiness of a network and its systems. Ethical hackers like white hats follow laws and regulations, working with the consent of the system owner. In contrast, black-hat hackers use Metasploit without legal authorization to exploit vulnerabilities, which is considered illegal. If and when the tool finds a vulnerability, the network admin can remediate the issue. To a black hat, Metasploit represents an attack tool that will identify a vulnerability and automatically proceed with the exploitation of that system flaw by delivering a malicious payload. Think of this software tool as being like a hammer. In the hands of a master builder, it can be used to create fantastic structures; in the hands of a bad actor, it can be used to wreak havoc and destruction.

Consider this example: A network admin runs a Metasploit scan on the company network as a routine security practice while looking for vulnerabilities. During the scan, a Windows XP client is discovered to be online. The admin is distraught about this discovery because, as you already know, Windows XP has been officially retired since 2009 and is extremely vulnerable to exploitation. This allows the admin to take immediate action before a bad actor can launch an attack against that client.

Original Text: Storage and Transport Encryption

In the examples presented so far, you have learned about two different encryption algorithms and how their keys are managed. We walked through an example of an email being changed from plaintext to ciphertext and then back to its original form. Those actions were applied to a specific item—in our case, the ice cream recipe. Encryption can also work with complete storage devices (disk drives and flash drives) and data while in transit over a network. Encrypted File System

In order to encrypt a file or folder in Windows, use the Encrypted File System (EFS) that is built into Windows (pictured above). This option is very easy to configure and is included as part of the NTFS file system. To do this, right-click on the file or folder you want to encrypt, click on Properties > Advanced, and then check the box that says “Encrypt contents to secure data.” You will then be asked to create a password. Each time someone attempts to open that specific resource, they will be prompted for the password to open it. Even if someone found your laptop and tried to open a file with a text editor like Notepad, they would just see the ciphertext and not be able to understand anything in the file. The password is our secret key; without it, the file is meaningless. Whenever you enable encryption, make sure you can remember your password or keep it in a safe place!

Note that, if you choose to use EFS to protect a file (like the one with our super-secret recipe in it), it is only encrypted on that specific Windows device. The Windows NTFS file system is what allows EFS to function. If the file is copied to another type of file system such as an older Windows FAT/FAT32 file system, the file will be decrypted during the copying process. Encrypting a file can give the user a false sense of security because they think that, if the file is copied or moved to another location, it will remain encrypted, but this is not always the case.

Updated Text: Storage and Transport Encryption

In the examples presented so far, you have learned about two different encryption algorithms and how their keys are managed. We walked through an example of an email being changed from plaintext to ciphertext and then back to its

original form. Those actions were applied to a specific item—in our case, the ice cream recipe. However, beyond the individual data items, network devices such as routers, switches, servers, and end-user devices themselves have vulnerabilities that can be exploited by malicious actors. These vulnerabilities can be due to out-of-date software, misconfigured settings, or hardware flaws. These can potentially expose to risks the data stored on them or the data they process. This is why encryption can also work with complete storage devices (disk drives and flash drives) and data while in transit over a network.

When designing an application, all states of data should be considered to ensure a secure product. 3 states of data: Data in Use, Data in Motion, Data at Rest by Jasper59, distributed under a CC BY-SA 3.0 license.

Transport Encryption

File and full-disk encryption are now on our list of the ways to secure data. We have complete confidence that our hardware is secure, and if it were ever lost or stolen, our recipes would be safe from bad actors attempting to gain access to them. Now, we turn our attention to securing data when we transmit it across a local network or the general internet. We learned previously that there are bad actors out there who can intercept network traffic, attempt to read its contents, and extract critical data. The bad news is that this happens every day when people connect to public Wi-Fi networks or use outdated operating systems and protocols to transmit data. Such instances highlight the vulnerabilities of network devices. For instance, if a router has a vulnerability, it could be exploited to intercept and alter the traffic that passes through it. Similarly, if a computer has a software vulnerability, it could be used to gain unauthorized access to sensitive data stored on it. The good news is that there are transport protocols available that can encrypt our network traffic. If you think back to the OSI model, you may recall that layer 4 facilitates the transport of packets and that layer 6 handles encryption after layer 5 helps to set up the communications session.

You may also recognize a few of the following protocols from previous discussions. Now that you're familiar with them, it should be much easier to understand how encryption can secure network traffic.

Original Text: Create Your Own Hidden Message!

Required Materials

Word processing software

Steganography software (optional)

Video or audio recorder (optional)

Image editing software (optional)

Step 1: Do-It-Yourself Steganography

You will probably not be surprised to learn that there are many websites that let you engage in your own steganography, either by downloading a program or working entirely through your browser. For this activity, you will use ANY form of steganography you'd like in order to create your own hidden message!

Step 2: So Many Choices...

Research online to find out which type of steganography you'd like to perform and what sort of secret message you'd like to embed. (Others will read it, so avoid profanity, insults, etc.). Use any form of steganography to record a message, keeping a copy of the original file that you used to embed the message. Submit the original, unmodified file and the file with the hidden message along with the answers to the following questions:

What form of steganography did you choose? What were its strengths and limitations? You may find it useful to compare the specific form you chose to other forms of digital steganography (image encryption, audio, mimic functions, video, packet manipulation, etc.).

What was your hidden message? How can it be decoded? (You may need to provide links to specific programs or websites).

How easy or difficult was the process overall?

Step 3: What to Submit

Your submission for this activity should include the following items:

the original file that you used to hide the original, unmodified message

the same file with the hidden message

a text file with the answers to the questions about the process, including instructions for how to access the hidden message

answers to the questions in Step 2

Updated Text: Create Your Own Hidden Message!

Required Materials

- Word processing software
- Steganography software (optional)
- Video or audio recorder (optional)
- Image editing software (optional)

Step 1: Do-It-Yourself Steganography

You will probably not be surprised to learn that there are many websites that let you engage in your own steganography, either by downloading a program or working entirely through your browser. For this activity, you will use ANY form of steganography you'd like in order to create your own hidden message!

Step 2: So Many Choices...

Research online to find out which type of steganography you'd like to perform and what sort of secret message you'd like to embed. (Others will read it, so avoid profanity, insults, etc.). Use any form of steganography to record a message, keeping a copy of the original file that you used to embed the message. Submit the original, unmodified file and the file with the hidden message along with the answers to the following questions:

Optional twist! Who's the best code breaker?

If you are working on this activity alongside fellow students, consider sharing your hidden messages—possibly using ideas from Activity 3 to encrypt them! You can keep your steganography and encryption methods secret to make the code extra-difficult to break!

1. What form of steganography did you choose? What were its strengths and limitations? You may find it useful to compare the specific form you chose to other forms of digital steganography (image encryption, audio, mimic functions, video, packet manipulation, etc.).

Students have many options:

- o Students may decide to hide messages in metadata or use an image-embedding application.
- o While different methods have different strengths and weaknesses, it is often the case that the easier the method is to use, the less secure the message is (as long as someone is suspicious enough to check it out!).
- o Some forms require software to decode them while others may be obvious with a simple file explorer.

2. What was your hidden message? How can it be decoded? (You may need to provide links to specific programs or websites).

Answers will vary, but students should describe a method that can be used to check that the message was successfully embedded.

3. How easy or difficult was the process overall?

Answers will vary, but most students should find the process quite simple. For example, a browser version may only require the uploading of an image and a message; it may not even store the files outside the web browser.

Step 3: Complete Historical Research on Cryptography

Complete your own online research on the history and evolution of cryptography. Be sure to highlight the origins, important developments, and how the use of cryptography has changed over time. How has cryptography been used

throughout history in areas such as war, politics, and technology? Write a short report highlighting your findings.

Step 4: Review Simple Methods of Cryptography

Research simple cryptography methods such as “shift cipher” and “substitution cipher.” Using your research, create an explanation of these methods in such a way that a five-year-old could understand. Then create and decipher your own simple messages with a classmate.

Step 5: Create a Hidden Message Using a Simple Cryptography Method

Decide between either the cipher or substitution cipher method to create a hidden message. Encode your message and then use steganography to hide it!

Step 6: What to Submit

Your submission for this activity should include the following items:

- the original file that you used to hide the original, unmodified message
- the same file with the hidden message
- a text file with the answers to the questions about the process, including instructions for how to access the hidden message
- answers to the questions in Step 2
- report on the historical uses of cryptography
- explanations and examples of the shift cipher and substitution cipher
- encoded and hidden message
- instructions on how to decode and access them

Original Text: Cyberbullying

Social media is a great tool, but like many tools—for example, hammers—it can be used either to create or to harm. How a tool is handled is up to the person wielding it. Social media platforms are awesome at connecting human beings, but they have also given rise to cyberbullying, which makes use of electronic communication to send messages that intimidate or threaten others—many times, children. The phenomenon—which this author calls “courage from behind a keyboard”—describes how people say and post things about a person that they would never say if they were standing in front of that person. Social media platforms have facilitated this phenomenon by making it very easy to send or post intimidating or threatening messages. In addition, cyberbullies can be tough to identify because they adopt fake names or can remain totally anonymous on some platforms.

A photo of a sad-looking young woman is shown with abusive words such as “worthless,” “bad,” and “ugly” written on the image.

Cyberbullying can have longer-lasting and more devastating effects than traditional bullying.

Cyberbullying can be an uncomfortable subject to talk about, but the discussion is necessary in order to raise awareness. Victims of constant cyberbullying can experience lasting negative consequences regarding their health and wellness, as illustrated below.

The following data was provided in response to an annual survey that asks students to identify issues that they attribute to their experiences with cyberbullying.

Updated Text: Cyberbullying

Social media is a great tool, but like many tools—for example, hammers—it can be used either to create or to harm. How a tool is handled is up to the person wielding it. Social media platforms are awesome at connecting human beings, but

Proclamation 2024: Report of Editorial Changes (11/08/2023)

they have also given rise to cyberbullying, which makes use of electronic communication to send messages that intimidate or threaten others—many times, children. The phenomenon—which this author calls “courage from behind a keyboard”—describes how people say and post things about a person that they would never say if they were standing in front of that person. Social media platforms have facilitated this phenomenon by making it very easy to send or post intimidating or threatening messages. In addition, cyberbullies can be tough to identify because they adopt fake names or can remain totally anonymous on some platforms.

Another form of online harassment that has arisen in the age of social media is cyberstalking. Cyberstalking is a specific form of cyberbullying that involves the use of technology to stalk or harass an individual or group. This can involve threats of harm, obsessive attention, and the creation of a climate of fear and intimidation. It can lead to severe emotional distress for the victims, and it can make them feel that they are being constantly watched or monitored, affecting their peace of mind and overall well-being.

Cyberbullying can be an uncomfortable subject to talk about, but the discussion is necessary in order to raise awareness. Victims of constant cyberbullying can experience lasting negative consequences regarding their health and wellness, as illustrated below.

The following data was provided in response to an annual survey that asks students to identify issues that they attribute to their experiences with cyberbullying.

Original Text: Step 2: What Is Terrorism?

Separate from the video, research several definitions of physical terrorism. Choose THREE definitions that have distinct differences or important parts to them. Then, copy each definition into a word processing file and provide a full citation for the source of each definition using any official style format (e.g., APA or MLA).

Based on your personal evaluation of those definitions, complete the following steps:

Synthesize the material from those definitions for yourself, and use it to write a fourth definition.

- Next, research and explain the difference between physical terrorism as you’ve defined it and cyberterrorism.

Then, research and explain the difference between terrorism and counterterrorism.

Create refined definitions for cyberterrorism and counterterrorism. You may find it useful to look up similar terms like “hactivist” or “state-sponsored terrorism” when creating these two new definitions.

Using your definitions, explain what makes something an act of terrorism as opposed to an act of rebellion, civil disobedience, liberation, fighting for freedom, military action, etc. In other words, explain the difference between a “terrorist” and a “freedom fighter,” “patriot,” or similar person (even a “counterterrorist”), or specify why your definition is unable to make that distinction.

Then, consider your own personal definition of terrorism and consider the implication in Greenwald’s video that, for many people, only terrorists need to worry about privacy. Explain whether that is true for the definition of terrorism you’ve landed on for yourself.

As a reminder, you may conduct independent research when composing your responses to these prompts. If you quote any source at length, be sure to provide an attribution; however, you do NOT need to write a full APA- or MLA-style citation for a quotation as the critical element is your personal reflection.

Step 3: What to Submit

Your submission for this activity should be a word processing file containing the following content:

Answers to the seven questions directly related to the video
Three definitions of physical terrorism with complete citations

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Your personal definitions of physical terrorism, cyberterrorism, and counterterrorism

An evaluation of the difference between a terrorist and a rebel or freedom fighter

An evaluation of whether it's true that only terrorists need to worry about privacy

Updated Text: Step 2: What Is Terrorism?

Separate from the video, research several definitions of physical terrorism. Choose THREE definitions that have distinct differences or important parts to them. Then, copy each definition into a word processing file and provide a full citation for the source of each definition using any official style format (e.g., APA or MLA).

Based on your personal evaluation of those definitions, complete the following steps:

- Synthesize the material from those definitions for yourself, and use it to write a fourth definition.
- Next, research and explain the difference between physical terrorism as you've defined it and cyberterrorism.
- Then, research and explain the difference between terrorism and counterterrorism.
- Create refined definitions for cyberterrorism and counterterrorism. You may find it useful to look up similar terms like "hacktivist" or "state-sponsored terrorism" when creating these two new definitions.

Using your definitions, explain what makes something an act of terrorism as opposed to an act of rebellion, civil disobedience, liberation, fighting for freedom, military action, etc. In other words, explain the difference between a "terrorist" and a "freedom fighter," "patriot," or similar person (even a "counterterrorist"), or specify why your definition is unable to make that distinction.

Then, consider your own personal definition of terrorism and consider the implication in Greenwald's video that, for many people, only terrorists need to worry about privacy. Explain whether that is true for the definition of terrorism you've landed on for yourself.

If you quote any source at length, be sure to provide an attribution; however, you do NOT need to write a full APA- or MLA-style citation for a quotation as the critical element is your personal reflection.

Step 3: Complete Your Own Research

The videos introduced several issues that affect both domestic and international interests. Find three national laws and two international laws that impact the world of cybersecurity. Investigate these laws and provide a brief explanation of the laws themselves and what they aim to accomplish. Next, perform an analysis of their effectiveness. Do you believe these laws effectively meet the needs of society and deter possible criminal behavior? Rationalize your reasoning.

Step 4: What to Submit

Your submission for this activity should be a word processing file containing the following content:

- Answers to the seven questions directly related to the video
- Three definitions of physical terrorism with complete citations
- Your personal definitions of physical terrorism, cyberterrorism, and counterterrorism
- An evaluation of the difference between a terrorist and a rebel or freedom fighter
- An evaluation of whether it's true that only terrorists need to worry about privacy
- An investigation and analysis of three national laws and two international laws that impact cybersecurity.

Submit your completed activity via the dropbox.

Original Text: Why do social media sites like Facebook and Twitter represent areas of concern for cybersecurity experts? What are the ways these sites are used by nefarious agents, and why are these sites difficult to control?

Answers will vary.

Generally, social media sites of all kinds and Facebook in particular are being targeted more and more by cybercriminals and by international propagandists. This is especially true when it comes to political news. Furthermore, it's easy to spread misinformation on these types of sites. It has been difficult for companies to control this because they have to balance security against profitability while being perceived as politically unbiased. The sites are used to spread misinformation, and the servers are hacked to gain user information (sometimes to help spread that misinformation). Previous units covered specific attacks on sites that could be used (e.g., injection attacks). Students may also mention these.

Updated Text: Why do social media sites like Facebook and Twitter represent areas of concern for cybersecurity experts, considering the legal ramifications involved? What are the ways these sites are used by nefarious agents to commit cybercrimes, and why are these sites difficult to control from a legal standpoint? How do cybersecurity laws and regulations come into play when addressing the security and privacy issues associated with social media platforms?

Answers will vary.

Generally, social media sites of all kinds and Facebook in particular are being targeted more and more by cybercriminals and by international propagandists. This is especially true when it comes to political news.

Furthermore, it's easy to spread misinformation on these types of sites. It has been difficult for companies to control this because they have to balance security against profitability while being perceived as politically unbiased.

Original Text: Malware in the Real World

For this activity, you will research different real-world malware attacks and create a chart that shows how each attack was performed and how much damage each attack caused.

If you've previously completed an activity in which you've researched real-world attacks—for example, a slideshow looking at different categories of cybersecurity breaches like man-in-the-middle attacks—you may include those same attacks in this exercise.

Research real-world incidents involving the following types of malware:

Worms

Trojans

Viruses

Backdoors

Spyware or a keyloggers

Botnets

Create a chart with a row for each of the six categories listed above. Next, create nine columns that contain the following information:

A one-sentence definition of the malware category

The name of the attack, if it has one

The year of the attack

The target of the attack

How the malware entered the system, if known

Who introduced the malware or is suspected of having introduced it, if known

The motivation behind the attack (or best guess for the motivation)

How much damage the malware is estimated to have caused (If no dollar amount is given, then a short description of the damage caused is acceptable.)

A link to a single article or webpage that provides a good overview of the attack

Make sure that your chart is formatted in a way that makes it easy to read and possible to compare characteristics of different types of malware. If any items are missing, write "N/A" in that cell.

Provide your submission in an Excel spreadsheet, Google Sheets file, or a document with a table in it that contains all the required information.

Original Text: Stepping Stones: From Job to Career

Required Materials

Word processing software

Step 1: Advancing in a Career

Relatively few people secure their dream jobs as the first jobs they are hired for; it's far more common to build a career over time, beginning with an entry-level position to gain experience and advancing through promotions or moving on to opportunities at other companies. For this activity, you will create a timeline of education, experience, and credentials required to advance as a cybersecurity professional.

Step 2: The End Goal

Choose a career goal that requires considerable experience, certifications, and "stepping stones" to pursue along the career path to that goal (for example, chief technology officer or CISO). If you don't have a specific career in mind, you may find it easiest to choose the highest level of certification that interests you, research which jobs require that certification, and then work backwards from there.

Once you've selected your end point, create a timeline, starting with your present-day position as a student. Then, plan out the major milestones required for you to achieve the final goal. There should be AT LEAST THREE intermediary steps.

For each milestone, besides the years of education and/or experience needed, be sure to include certifications, requirements, portfolio elements, etc., that such a job would entail. (You can easily determine this by quickly searching online for job postings for the position in question.)

You can present your timeline in whatever format you think is best. Just make sure you include three steps beyond your current situation as a student.

Step 3: What to Submit

Your submission for this activity should be a timeline that includes at least FIVE total nodes covering the education, experience, certifications, etc., required to advance in a cybersecurity career.

Complete your timeline in a word processing document, and submit it via the dropbox.

Original Text: Career Opportunities

Where Are the Opportunities?

When you consider the need for cyber professionals, industries like healthcare, intelligence agencies, and banking may be the first areas that come to mind. Here's a quick challenge for you: Name a business or industry that does not need a cyber professional.

Okay, enough with grocery stores. This should be easy. Guess again.

Let's look at just 10 of the many career paths in the cybersecurity industry. These descriptions can only provide a brief overview, so you should continue to research on your own any of the career paths that interest you. As you may have noticed, all cybersecurity professionals must be able to solve problems, think critically, employ a variety of skill sets, and be a lifelong learner. The field changes rapidly; each day presents new challenges that have never been encountered before.

Security Specialist

This is an entry-level role that is a fantastic starting point. Security specialists are responsible for several of the duties we discussed in this course: monitoring for system anomalies, keeping systems patched, delivering security training to employees, and ensuring security tools such as antivirus and software firewalls are running properly. As your skills improve and you receive more training, you can begin moving up the ladder into management roles. This type of position usually requires a two-year associate's degree and industry certifications.

The median salary for a security specialist is \$99,730.

Incident Responder

This career path puts you in charge of data and security breaches in an organization. You need to work rapidly and decisively in stressful emergency situations to solve issues as quickly as possible and take action to prevent further problems. Incident responders must be able to recognize potential errors or vulnerabilities in a network, develop procedures to follow when a security event occurs, collaborate with other team members, run preventative security audits, and provide detailed reports after an event occurs. A degree is not necessary for an entry-level position, but it will likely require technical certifications. As you gain work experience in this particular career path, a four-year technical bachelor's degree will help you progress up the ladder.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

The median salary for an incident responder is \$52,160.

Cryptographer

This is a highly specialized path for good problem solvers who love math and writing code. Cryptographers create the algorithms and encryption methods to keep data and communications secure. The National Security Agency (NSA) is an example of an agency that is looking for highly qualified and trustworthy cryptographers. This position does require a four-year bachelor's degree in computer science, computer engineering, or math.

The average salary for a cryptographer is \$73,000.

Security Analyst

This position reports to a company's CISO. The analyst has a critical role. They constantly analyze security policies of the organization and look for vulnerabilities or weaknesses in its network. An analyst also makes recommendations about whether hardware and software platforms meet the organization's needs and fit its budget. This position requires industry certifications and a technical bachelor's degree.

The median salary for an analyst is \$99,815.

Security Auditor

An auditor needs to be a very organized person. They're the person who is specifically appointed to review an organization's internal policies and procedures to ensure that the organization follows best practices and complies with regulations. Once an audit is complete, the auditor compiles the results into a detailed report that is then presented to management. The work of the auditor hopefully leaves the incident responder with a lot of spare time! The security auditor position requires a technical bachelor's degree and, usually, five years of experience in information technology.

The median salary for a security auditor is \$99,730.

Penetration Tester/Ethical Hacker

Also known as white hat hackers, these people break into systems from outside of the network. Pen testers are hired by organizations to test their defenses and make recommendations to improve them. An auditor checks the internal policies and procedures of an organization, whereas a pen tester verifies that the perimeter of a network is configured correctly and prevents intrusions or data breaches. Pen testers confirm that firewalls, IDS/IPS, and web-based applications are functioning properly and keeping intruders out of the network.

A man in a suit stands in the background behind the words "WHITE HAT HACKER" and several glowing icons showing people in white hats. The man reaches out to touch one icon that pictures an open lock.

White hat hackers, also known as ethical hackers or penetration testers, are the good guys working to protect networks and systems against attacks by black hat hackers.

Pen testers must have deep knowledge of how networks and operating systems function. They basically need to be able to break into any system, and this requires a wide variety of skills, from a knowledge of numerous programming languages to computer forensics. A four-year bachelor's degree, multiple years of work experience, and technical certifications are required.

The median salary for a penetration tester is \$104,000.

Updated Text: Career Opportunities

Where Are the Opportunities?

When you consider the need for cyber professionals, industries like healthcare, intelligence agencies, and banking may be the first areas that come to mind. Here's a quick challenge for you: Name a business or industry that does not need a cyber professional.

Okay, enough with grocery stores. This should be easy. Guess again.

Let's look at just 10 of the many career paths in the cybersecurity industry. These descriptions can only provide a brief overview, so you should continue to research on your own any of the career paths that interest you. As you may have noticed, all cybersecurity professionals must be able to solve problems, think critically, employ a variety of skill sets, and be a lifelong learner. The field changes rapidly; each day presents new challenges that have never been encountered before.

Moreover, these cybersecurity roles often operate within various functional areas of an organization's cybersecurity structure, providing different types of services. Functional areas of cybersecurity may include operations and maintenance, vulnerability management, identity and access management, risk management, incident response, and governance.

Security Specialist

This is an entry-level role that is a fantastic starting point. Security specialists are responsible for several of the duties we discussed in this course: monitoring for system anomalies, keeping systems patched, delivering security training to employees, and ensuring security tools such as antivirus and software firewalls are running properly. As your skills improve and you receive more training, you can begin moving up the ladder into management roles. This type of position usually requires a two-year associate degree and industry certifications. A security specialist typically operates within the functional area of operations and maintenance, providing services such as regular system updates and monitoring for potential security issues.

The median salary for a security specialist is \$99,730.

Penetration Tester/Ethical Hacker

Also known as white hat hackers, these people break into systems from outside of the network. Pen testers are hired by organizations to test their defenses and make recommendations to improve them. An auditor checks the internal policies and procedures of an organization, whereas a pen tester verifies that the perimeter of a network is configured correctly and prevents intrusions or data breaches. Pen testers confirm that firewalls, IDS/IPS, and web-based applications are functioning properly and keeping intruders out of the network.

Pen testers must have deep knowledge of how networks and operating systems function. They basically need to be able to break into any system, and this requires a wide variety of skills, from a knowledge of numerous programming languages to computer forensics. A four-year bachelor's degree, multiple years of work experience, and technical certifications are required.

The median salary for a penetration tester is \$104,000.

Original Text: "How Do I Prepare?"

While we did not cover an exhaustive list of options for careers in cybersecurity, you can get a sense of just how many possibilities there are from the list presented in the previous lesson. All of the roles described rely on the foundational and fundamental technical knowledge that we have discussed in this course. From that foundation, there are many places that you can go! So, how do you build that knowledge? Do you have to go to a four-year college to become a cybersecurity professional? As you are now aware, some career paths do call for four-year degrees while others require industry certifications and job experience. Regardless of which cybersecurity role you choose, you must be a lifelong learner and keep up with developments in a constantly changing industry.

If there are topics and that have captured your attention, you can begin your training while you're still in high school. Investigate whether your school offers career and technical education (CTE) that provides the academic and technical skills required to succeed in cybersecurity. Also, consider which functional area of cybersecurity you might be interested in and seek out courses or certifications that align with that area. CTE programs give you foundational knowledge in

Proclamation 2024: Report of Editorial Changes (11/08/2023)

networking, programming languages, database management, and operating systems.

If your school does not offer CTE courses or opportunities, do some research online to find institutions that do. Evolving topics like these may not be available at all schools, so you may need to take the initiative by seeking out the content and working hard to study and apply what you learn. You will discover that much of cybersecurity education relies on you being a self-motivated learner. This same motivation will be necessary as you seek to specialize in a functional area within cybersecurity and learn about the unique services each of these areas provides.

Educational Options

Check your local community college programs. Many two-year institutions offer affordable courses in network security, programming, and data/information sciences. You might find courses focusing on different functional areas of cybersecurity, such as Incident Response or Security Architecture, allowing you to further refine your career path. Courses may also include the option to take certification exams like CompTIA Network+. Community colleges are fantastic places to obtain two-year associate's degrees in subjects you find interesting. Then, if you wish, you can continue to a university to complete a four-year bachelor's degree in a subject area you already know you enjoy. Many high schools also offer dual enrollment that allows you to take college classes that count for both high school and college credit. Set up a meeting with your counselor to see what options are available to you.

If you are considering college as your next step to learning more about cybersecurity, some of the majors you should research are listed below. During your research, you will likely discover that schools use slightly different names to identify majors, depending on how the programs are structured, but they are still related to cybersecurity.

Industry certifications are other options that you can investigate on your own. CompTIA has a large selection of certifications that provide the foundational knowledge needed to obtain an internship. Check out the following certifications.

Each functional area of cybersecurity provides unique services. For instance, in Incident Response, services might include disaster recovery planning or incident mitigation. In Risk Management, services could include vulnerability assessments or the creation of security policies. Each of these certifications builds on the knowledge of the previous one. Many of the career paths described earlier require these certifications. For example, you would be unlikely to succeed at PenTest+ certification without having previously studied the concepts covered in both Network+ and Security+. This is because a pen tester needs robust knowledge of the OSI model in order to be successful, and Network+ helps build the fundamental networking knowledge needed to continue developing your level of expertise. The same would be true if you were interviewing for a network administration position. Network+ certification would verify that you understand TCP ports and protocols.

..

Updated Text: This breakout has multiple possible interpretations. It could be read as asking students to publish the results of a job search through multiple types of "output" media (e.g. a report, PDF, online blog or social media post). However, job searches are inherently private exercises and individuals rarely publish their ongoing efforts in this manner, so we do not believe instructing students to do this was intended. A more likely interpretation is that students must report on their findings when searching through various types of job listings; online websites, newspapers, physical

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3429 of 3538

advertisements, and in-person job fairs can all be considered different types of "source" media. We have added a table of alternate media sources (beyond job-search websites) at the end of our new "Contacting Employers - Job Searches" section in this lesson.

Original Text: What Computer Science Programs Are Out There? Required Materials Word processing software Writing supplies (optional) Canva (requires login) There are many possible paths you can take after high school, including attending a community college or university, getting a job, attending a vocational or trade school, or getting an internship. In this activity, you will compare computer science programs that are available at different universities. Regardless of whether you want to go into the computer science field, you'll develop your employability skills in this activity by researching, comparing, and summarizing the options available. Step 1: Explore Using a browser, navigate to the websites of three universities of your choice. Find their computer science departments, and investigate what kinds of degrees they offer. In a word processing document or using pen and paper, take notes on the computer science degree that interests you the most for each university. You will need these notes later to develop your deliverable. Step 2: Compare How do the three programs compare to each other? What are the similarities and differences? Which one stands out to you the most? Which one would be your dream program? Add comparative notes to your document. Step 3: Summarize Using Canva, create an infographic that summarizes your findings. Include at least one image per program, and be sure to summarize the information about that program. Imagine that your infographic is going to be displayed in a high school computer science classroom to help other students decide what program may be a good fit for them. Make sure that it's engaging, accurate, and helpful. Step 4: What to Submit Create a link to, or a PDF of, your infographic and submit it to the dropbox.

Updated Text: There are many possible paths you can take after high school, including attending a community college or university, getting a job, attending a vocational or trade school, or getting an internship. In this activity, you will compare internships and computer science programs that are available at different universities. Regardless of whether you want to go into the computer science field, you'll develop your employability skills in this activity by researching, comparing, and summarizing the options available. Step 1: Explore Using a browser, navigate to the websites of three universities of your choice. Find their computer science departments, and investigate what kinds of degrees they offer. Next, research three internships that are of interest to you, ideally in the field of computer science. Be sure to research the pros and cons of each internship, including your responsibilities within the company as well as the compensation or experience that will be gained. In a word processing document or using pen and paper, take notes on the computer science degree that interests you the most for each university and the potential research opportunities. You will need these notes later to develop your deliverable. Step 2: Compare How do the three programs compare to each other? What are the similarities and differences? Which one stands out to you the most? Which one would be your dream program? Which of the three internships is the most appealing to you? Why? Add comparative notes to your document. Step 3: Summarize Using Canva, create an infographic that summarizes your findings. Include at least one image per program and one image per internship, and be sure to summarize the information about that program. Imagine that your infographic is going to be displayed in a high school computer science classroom to help other students decide what program may be a good fit for them. Make sure that it's engaging, accurate, and helpful.

Link to Updated Content:

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3432 of 3538

Original Text: How Can I Market My Skills? Required Materials Weebly (requires login) Word processing software You have come to the end of this course, and hopefully you are excited about the new skills you've learned! You have accumulated many examples of your work throughout the activities and added them to your Weebly website. This can serve as a digital portfolio to showcase your skills. Now, to tie everything together, you will create a mock résumé and pretend to be a young professional ready to embark on a search for your dream job. As part of this search, you will also examine the role of certifications in the computer science profession. Step 1: Gather Information Using the previous activities and your Weebly website as a starting point, gather information that could influence your résumé: your skills, projects, personality tests, and anything else that you can use as inspiration. Step 2: Imagine Your Future Self With the information you gathered in Step 1, pick a specific focus or track. We're going to update your website to highlight that focus a little more. For example: Did you really enjoy coding the adventure game? Maybe you want to highlight your programming skills. Did you love learning about cybersecurity? Maybe you want to highlight that interest. Are you passionate about presentations and communication? Maybe you want to focus on project management. Just because you're picking a focus for this project doesn't mean you will be stuck with it for the rest of your life. There's always room for growth and change! For right now, choose a focus that you resonated with and want to use to show off your IT skills. With that focus in mind, review your Weebly website and make any updates you would like to so that the website clearly shows off who you are and what your main interest is today. Most importantly, review the landing page of your website which you created way back at the beginning of the course. Your thoughts and knowledge about IT are going to be different than they were at that point, so update the page to reflect who you are now. Step 3: Create Your Résumé Typically, you would create a résumé after finding a job to apply for, and you would tailor your résumé to highlight the qualifications and responsibilities the job description asks for. In this case, you can use the career you chose in the previous unit or a career that fits the focus you established in Step 2. In a new word processing document, create your résumé. You may want to use a template to make your résumé look professional. Make sure your résumé has the following sections: Header with your personal information Professional objective Work experience Education Skills Certifications and licenses Assume that you already have a degree or certification in the area you are applying for. Review the lessons for an appropriate certification or do some research to find one that appeals to you. You can also pretend that you have completed additional training, are a member of a professional organization, have attended seminars, etc. This is your future self, so imagine what you will have accomplished in the next five to 10 years, and use that as a starting point for your résumé. Make it believable, and make it your own! Step 4: What to Submit When you have finished the homepage of your website, click Publish in the upper-right corner. Submit your résumé and the URL to your website to the Dropbox.

Updated Text: You have previously completed research into what careers would be a good fit for your interests and skills. Now, you will focus on what skills you still need to develop in the future in order to be qualified for your career. You will and develop create a plan of action to gain these skills, either through direct education, internships, or other training resources. Step 1: Choose a Career In the unit on presentations, you identified three careers as a possible good fit for you, specifically in the activity titled, "What Skills Are Important for My Future Career?" Now choose one of those careers and, if you haven't already, make a list of the skills that are required for that career. The best way to do this is to first check job descriptions for job duties and tasks that will be expected of you. Job duties and tasks for computer science or IT professionals, for example, might include coding in a specific programming language, maintaining computer systems, delivering a product, creating reports, or even managing a team of developers! Tasks might include writing code in a specific programming language, diagnosing and resolving hardware and software issues, analyzing network traffic, optimizing performance, and keeping track of inventory. Once you've mapped out the job duties and tasks required of you, you'll have a better idea of what specific skills you will need to develop. Step 2: Draft a Skill Development Plan Now that you have identified the skills required for this future career (the one you do not have yet), m. Make a plan for how you will obtain those skills. Will you get a university degree, apply for an internship, shadow a professional, take an online course on a platform like Coursera or Udemy, or do something else? For this activity, choose at least one degree, one internship, and one alternative training resource to show you've researched each area of interest. Be sure to describe how obtaining these skills will help you be better qualified for the job duties and tasks that will be required in your new position. When planning for the future, it is important to be as specific as possible so that your goals will be attainable. Part of being specific is planning a timeline which identifies when you will accomplish your goals. Make sure to include

specific time frames for the skills you need to develop. Your timeline can be provided in a written description, table, or infographic. Step 3: Put It All Together Create a new page for your website on Weebly. Give this new page an appropriate title and then add your skill development plan.

Original Text: If you aren't aware of what's going on in the IT world, you may find yourself falling behind in your job (whatever field it's in) or even in your personal life as you decide what products and services are worth your time. Of course, we don't always want to frantically pursue the latest trends, but when you know what's going on in your community and around the world, you can adjust your career plans and life goals accordingly. Business Challenges Businesses and organizations face a whole range of challenges. Some of these are addressed by technology, but others are not. Before a business rushes to invest in the latest technology, the business should consider whether it actually has a challenge that the technology can solve. If not, the business risks wasting precious resources like time and money. The challenge should be identified before looking for or investing in technology to use. For example, let's say that a hotel manager hears about a new communication app that looks amazing. The manager buys the app, installs it on all the staff tablets, and tells staff members that they should use it to communicate with each other and with customers. But the well-intentioned plan fails because there was no problem with communication in the first place. The way in which staff members communicated with each other and with customers was already working effectively and efficiently. Some staff embraced the new app, but most did not because they did not see the point in changing something that was not broken or inefficient. Before investing in the new communication app, the hotel manager should have evaluated the current system and surveyed staff to get an idea of how well the current process was working. Without a challenge to address, technology provides not a solution but merely another distraction. So, what are some actual business challenges that technology can address? Let's explore some basic, common business needs and challenges and what particular kinds of technology can help.

Updated Text: Business Challenges Businesses and organizations face a whole range of challenges, especially when it comes to computer science and IT-related fields. Some of these are addressed by technology, but others are not. Before a business rushes to invest in the latest technology, the business should consider whether it actually has a challenge that the technology can solve. If not, the business risks wasting precious resources like time and money. The challenge should be identified before looking for or investing in technology to use. This is where someone experienced in computer science and IT comes into play. An IT professional will often have enough technical experience to make recommendations based not only on the technology itself but the potential impact on the user experience as well. As such, one job task you'll likely encounter in computer science and IT is consultation. Consultants are specifically tasked with figuring out complex problems for businesses to make the least negative impact on the customers and can perform tasks such as diagnosing and resolving hardware and software issues, analyzing network traffic, and optimizing performance. For example, let's say that a hotel manager hears about a new communication app that looks amazing. The manager buys the app, installs it on all the staff tablets, and tells staff members that they should use it to communicate with each other and with customers. But the well-intentioned plan fails because there was no problem with communication in the first place. The way in which staff members communicated with each other and with customers was already working effectively and efficiently. Some staff embraced the new app, but most did not because they did not see the point in changing something that was not broken or inefficient. Before investing in the new communication app, the hotel manager should have evaluated the current system and surveyed staff to get an idea of how well the current process was working. Without a challenge to address, technology provides not a solution but merely another distraction, and without an IT professional or consultant, they failed to properly identify the needs of the business first. Rather than switching to a new app, the

consultant may delegate tasks to the IT team to upgrade the hardware itself to make their systems run even better, while keeping the original app due to its familiarity. So, what are some actual business challenges that technology can address? Let's explore some basic, common business needs and challenges and what particular kinds of technology can help.

Link to Updated Content:

[View Updated Content](#)

Original Text: How Can I Market My Skills? Required Materials Weebly (requires login) Word processing software You have come to the end of this course, and hopefully you are excited about the new skills you've learned! You have accumulated many examples of your work throughout the activities and added them to your Weebly website. This can serve as a digital portfolio to showcase your skills. Now, to tie everything together, you will create a mock résumé and pretend to be a young professional ready to embark on a search for your dream job. As part of this search, you will also examine the role of certifications in the computer science profession. Step 1: Gather Information Using the previous activities and your Weebly website as a starting point, gather information that could influence your résumé: your skills, projects, personality tests, and anything else that you can use as inspiration. Step 2: Imagine Your Future Self With the information you gathered in Step 1, pick a specific focus or track. We're going to update your website to highlight that focus a little more. For example: Did you really enjoy coding the adventure game? Maybe you want to highlight your programming skills. Did you love learning about cybersecurity? Maybe you want to highlight that interest. Are you passionate about presentations and communication? Maybe you want to focus on project management. Just because you're picking a focus for this project doesn't mean you will be stuck with it for the rest of your life. There's always room for growth and change! For right now, choose a focus that you resonated with and want to use to show off your IT skills. With that focus in mind, review your Weebly website and make any updates you would like to so that the website clearly shows off who you are and what your main interest is today. Most importantly, review the landing page of your website which you created way back at the beginning of the course. Your thoughts and knowledge about IT are going to be different than they were at that point, so update the page to reflect who you are now. Step 3: Create Your Résumé Typically, you would create a résumé after finding a job to apply for, and you would tailor your résumé to highlight the qualifications and responsibilities the job description asks for. In this case, you can use the career you chose in the previous unit or a career that fits the focus you established in Step 2. In a new word processing document, create your résumé. You may want to use a template to make your résumé look professional. Make sure your résumé has the following sections: Header with your personal information Professional objective Work experience Education Skills Certifications and licenses Assume that you already have a degree or certification in the area you are applying for. Review the lessons for an appropriate certification or do some research to find one that appeals to you. You can also pretend that you have completed additional training, are a member of a professional organization, have attended seminars, etc. This is your future self, so imagine what you will have accomplished in the next five to 10 years, and use that as a starting point for your résumé. Make it believable, and make it your own! Step 4: What to Submit When you have finished the homepage of your website, click Publish in the upper-right corner. Submit your résumé and the URL to your website to the Dropbox.

in the area you are applying for. Review the lessons for an appropriate certification or do some research to find one that appeals to you. You can also pretend that you have completed additional training, are a member of a professional organization, have attended seminars, etc. This is your future self, so imagine what you will have accomplished in the next five to 10 years, and use that as a starting point for your résumé. Make it believable, and make it your own! Step 4: Plan of Action Now that you have a résumé, it's time to set up a plan of action. Find at least three potential employers you would want to contact regarding an employment opportunity and document their preferred application or contact method. You'll want to write out the steps you'll take to prepare your cover letter before contacting these potential employers, as well as what is needed in the application process. In some cases, you'll want to take note of the hiring manager's email address to contact them directly; in other cases you may need to document the application process to better prepare, especially if an exam is required. Sometimes this process is listed within the job description itself. This information may change over time, but such exploration will give you a better understanding about the process of contacting employers to investigate job opportunities in the future. Step 5: What to Submit When you have finished the homepage of your website, click Publish in the upper-right corner. Submit your résumé, plan of action document, and the URL to your website to the dropbox.

Original Text: Join a School Club Perhaps the easiest place to get plugged in is at a local school. Some high schools already have IT clubs in place that meet at lunchtime or after school. If your local school does not, consider asking whether you could start such a club, or try to find one at a nearby library or community center. An IT club might meet weekly to work on a programming challenge, build a network, learn a new type of software, create a robot, construct a custom computer, or read current technology news, among many other topics. Join a National Club Besides local school clubs, you may also be able to take part in nationally organized clubs. You may be able to join or start a chapter (the local branch of a society or club), or you might participate in an online club. Let's explore some of the opportunities with various national and worldwide clubs. Besides learning and sharpening new IT skills, participating in an IT-related organization or club can help set you on the right track to serving your community. Community service can be defined as voluntary work with people who need help in a certain area. Your local club might decide to design and code an app to help with a particular community need such as housing, entertainment, or transportation.

Updated Text: Join a National Club Besides local school clubs, you may also be able to take part in nationally organized clubs. You may be able to join or start a chapter (the local branch of a society or club), or you might participate in an online club. Let's explore some of the opportunities with various national and worldwide clubs. Besides learning and sharpening new IT skills, participating in an IT-related organization or club can help you find new career opportunities. Employers are often tightly networked with organizations like the FBLA (Future Business Leaders of America) and CoderDojo to find new and upcoming talent. Clubs and organizations can help put you in contact with potential internship or even job opportunities. Furthermore, clubs can help help set you on the right track to serving your community. Community service can be defined as voluntary work with people who need help in a certain area. Your local club might decide to design and code an app to help with a particular community need such as housing, entertainment, or transportation. This is great practice for the developers and a valuable asset to the community. Collaborating with local community officials and participating in a project that is bigger than yourself can help you gain a broader perspective. If you have been inspired, challenged, or motivated by a teacher, volunteer, or IT professional, you know how big of a difference it made in your life. Why wouldn't you want to give back to the community in a tangible way using

your IT skills? Beyond that, the reputation and experience you'll gain along the way will look great on your résumé and portfolio as you begin to contact potential employers.

Link to Updated Content:

[View Updated Content](#)

Original Text: What Do I Know about Peripherals, Processors, and Memory? Required Materials Word processing software Video recording device Peripherals are important parts of the computing experience. After all, how could you watch your favorite show without earbuds? Or how could you type up that history paper without a keyboard? And of course, no computing device could function without a processor or memory. In this activity, you will be demonstrating your knowledge of computer components such as input/output devices, the CPU, and primary storage by creating an informative video. Step 1: Locate a Device Find a computer (desktop or laptop) which has plenty of peripherals, cables, and connectors. If you have access to a computer lab at school or a local library, the computers in those places typically have several peripherals. Step 2: Identify Peripherals Before you start shooting your video, outline a plan in a word processing document for what you will talk about. First, identify as many peripherals on the computer as you can. Separate them into input and output. Creating a table would be great for this step. Next, explain the purpose of each peripheral and how to use it. Practice demonstrating the use of at least one peripheral. Finally, talk about several ports that you see and what kinds of cables are (or could be) connected. Step 3: Find the Specs Next, check out your computer's specs (short for specifications), which is information about the computer's internal components. We are interested in CPU and RAM. Finding the specs varies from device to device. If you're using a Windows-based computer, go to the Start menu, click on Settings, and then scroll down to About. You should see your device specifications listed. Device specifications for Processor and Installed RAM. If you're using a Chromebook, type Diagnostics into the ChromeOS search bar and open the settings section. You should see the type of CPU, its speed, and how much memory is available. If you're using a MacBook, click on the Apple icon in the upper left of your screen, and click on About this Mac. You'll see the processor and memory details displayed. Once you've located the CPU and memory specs, record them in your word processing document and plan to demonstrate how to find them in your video. Step 4: Record a Video With your plan in mind, record your video. You may want to have a friend hold the recording device, or you may want to prop it up so that you have both your hands free to demonstrate how the peripherals are used. Step 5: What to Submit Submit the word processing document and your video file to the dropbox.

Updated Text: Step 3: Find the Specs Next, check out your computer's specs (short for specifications), which is information about the computer's internal components. We are interested in CPU and RAM. Finding the specs varies from device to device. If you're using a Windows-based computer, go to the Start menu, click on Settings, and then scroll down to About. You should see your device specifications listed. If you're using a Chromebook, type Diagnostics into the ChromeOS search bar and open the settings section. You should see the type of CPU, its speed, and how much memory is available. If you're using a MacBook, click on the Apple icon in the upper left of your screen, and click on About this Mac. You'll see the processor and memory details displayed. Once you've located the CPU and memory specs, record them in your word processing document and plan to demonstrate how to find them in your video. Step 4: CreatAdding Variety Now that you've completed the process for one type of processor, find a second type of processor to document. If you picked a Windows- based laptop, for example, you may elect to choose a desktop computer, tablet, Chromebook, or even a phone! You may even find different processor types between similar devices. For example, some older Apple computers use the same Intel-based processors you would find on a Windows-based PC, while newer Apple computers use their own proprietary processors, known as M1 or M2 processors. Step 5: Createing Yyour Script Now that you have an outline, it's time to plan your script. Since you're essentially teaching this information, you want to word things in a

way that is easily understood by a wide audience. In your script, identify and explain the functions of all basic computer components, including the CPU, storage, and peripherals, in a way that someone new to technology can understand. You may elect to use examples in your descriptions, explaining how the CPU can speed up processing tasks or that RAM can be useful for multitasking since you can have more programs open at once before things start to slow down. Don't forget your peripherals, either! All of your input devices and output devices are just as important to a complete computer system. YBe sure to include definitions of the following in your scriptou should cover at least the following: • Input Devices (mice, keyboards, webcams, microphones, etc.) • Output Devices (monitors, speakers, etc.) • Processors (CPU) • Graphics Cards (GPU) • RAM (be sure to explain to the audience the difference between RAM and ROM) • Primary/Secondary Storage Devices (be sure to explain their uses, as well as the differences between hard drives and solid state drives and what it means when a drive is internal or external) Step 64: Record a Video With your plan in mind, record your video. You may want to have a friend hold the recording device, or you may want to prop it up so that you have both your hands free to demonstrate how the peripherals are used. Step 75: What to Submit Submit the word processing document and your video file to the dropbox.

- Digitizing Abuse link broken in both instructions and resources

Topic 7, Unit 2: Teen Suicide I

- Teen Suicide video link links to an article titled different, not a video in both instructions and resources

Topic 7, Unit 4: Positive Parenting

- Both teaching aids not labeled ULTRA, potentially linked incorrectly, in both instructions and resources

Topic 7, Unit 4: Parenting Teens

- Parenting Teens link not found in both instructions and resources

- Link titled "Surviving the Teen Years" links to a different article in both instructions and resources

Topic 7, Unit 4: Dealing with Teen Issues

- Rubric for Role-play not linked in resources, only in instructions

Topic 8, Unit 1: Physical Development

- Rubric for Essay broken in both instructions and resources

Topic 8, Unit 1: A Healthy Body

- Healthy Living Guide incorrectly linked in instructions and resources
- A well guided tour of your body incorrectly linked in resources
- Health Tips for Adults incorrectly linked in resources

Topic 8, Unit 1: Stress I

- Stress Smarts Quiz link does not link to a quiz in both instructions and resources

Topic 8, Unit 1: Stress II

- Science of Stress video not found in both instructions and resources

Topic 8, Unit 1: Obesity

- The Obesity Epidemic video not found in both instructions and resources

Topic 8, Unit 1: Nutrition and Stress

- Managing Stress: A Guide for College Students link not correct in both instructions and resources
- Rubric for Menu Planning broken in both instructions and resources

Topic 8, Unit 1: Health and Safety During College

- Posterini resource no longer active in both instructions and resources
- Rubric for Poster link broken in both instructions and resources

Topic 8, Unit 2: Marriage Preparation

- Relate Institute link not found in both instructions and resources

Topic 8, Unit 3: Marriage Across Cultures

Proclamation 2024: Report of Editorial Changes (11/08/2023)

- Posterini resource no longer active in both instructions and resources

Topic 8, Unit 3: Quitting Smoking

- Rubric for Business Letter link broken in both instructions and resources

- Kick Butts Day resource directs to something different (I think the campaign was renamed) in instructions and resources

Topic 8, Unit 3: Binge Drinking

- Binge Drinking video link directs to something different in both instructions and resources

- Binge Drinking video transcript not labeled ULTRA, potentially incorrectly linked, in instructions and resources

Topic 9, Unit 1: Seven Healthy Habits

- My Life Check – Simple 7 is now renamed to Essential 8, need to change name in instructions and lesson title

- Posterini resource no longer active in both instructions and resources

Topic 9, Unit 1: Exercise I

- Video links to a different article in both instructions and resources

Topic 9, Unit 1: Obesity and Healthy Weight

- Video links to a different video

Topic 9, Unit 1: DASH Diet

- Video no longer publicly available in both instructions and resources

Topic 9, Unit 1: Lifelong Learning

- Bernard Osher Foundation link broken in both instructions and resources

- Rubric for Fact Sheet broken in both instructions and resources

Topic 9, Unit 2: Levinson's Theory

- Toondoo no longer active in both instructions and resources

Topic 9, Unit 2: Age Discrimination

- Posterini no longer active in both instructions and resources

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Topic 9, Unit 2: Midlife Crisis

- Class Debate Listener form link broken in instructions only

Topic 9, Unit 2: Sandwich Generation I

- The Sandwich Generation resource not found in both instructions and resources

Topic 10, Unit 1: Physical Appearance

- Rubric for Timeline broken in both instructions and resources

Topic 10, Unit 1: Assistive Technology

- Rubric for Print Advertisement broken in both instructions and resources

Topic 10, Unit 1: Nutrition

- Let Food be Thy Medicine video incorrectly linked in instructions only

Topic 10, Unit 1: Eating Healthy

- Making Healthy Food Choices video links to something different in both instructions and resources

Topic 10, Unit 1: Nutrient-dense Foods

- Choosing Nutrient Dense Foods video is no longer publicly active in both instructions and resources

Topic 10, Unit 1: Alzheimers Disease II

- Posterini no longer active in both instructions and resources

Topic 10, Unit 1: Alzheimers Disease III

- All links in this lesson no longer found/broken in both instructions and resources

Topic 10, Unit 1: Home Safety

- Home Safety links broken in both instructions and resources
- Caregiverstress.com links to something different in both instructions and resources

Topic 10, Unit 3: Looking for Work

- An Aging Workforce link broken in both instructions and resources

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Topic 10, Unit 3: Elder Abuse

- Rubric for Podcast link broken in both instructions and resources

Topic 10, Unit 3: Adult Protective Services

- Mickey Rooney link broken in both instructions and resources
- Rubric for Fact Sheet link broken in both instructions and resources

Topic 11, Unit 1: Social Network Sites

- Facebook Can Help or Hurt Your Career link broken in both instructions and resources

Topic 11, Unit 1: Securing Employment

- Rubric for Presentation link broken in both instructions and resources

Topic 11, Unit 1: Interviews I

- Texas Workforce Commission link broken in both instructions and resources

Topic 11, Unit 3: Family, Career, and Community Leaders of America I

- Guide to Branding and Promoting FCCLA link broken in both instructions and resources

Topic 11, Unit 3: Leadership Styles II

- Rubric for Roleplay or Skit link broken in both instructions and resources

Topic 11, Unit 4: Influences I

- Decisions and Influences link broken in both instructions and resources

Topic 11, Unit 5: Problem Solving II

- All links are downloadable PDFs that look like outside resources, they are not labeled ULTRA and may be incorrectly linked in both instructions and resources

Topic 11, Unit 5: Conflict Resolution

- Rubric for Roleplay or Skit broken in both instructions and resources

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Topic 11, Unit 5: Negotiation

- Rubric for visual display broken in both instructions and resources

Topic 12, Unit 2: Education and Training Cluster II

- Rubric for Billboard broken in both instructions and resources

Topic 12, Unit 2: Entrepreneurs II

- Lucidpress renamed to Marq and should be renamed in both instructions and resources

Topic 13, Unit 1: Resumes

- Resume Components mis-titled Recipe Components in resources

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3497 of 3538

Original Text: Cumulative Project: How Do You Administer Medications?

Required Materials

Video recording device

Various household items (optional)

You learned about how to prepare and administer medications in this unit. Now it's time to demonstrate your new knowledge. In this activity, you will create a video to model proper techniques. Of course, you will not be using real medications or asking anyone to ingest anything, but you can use household props to help in your demonstration if you'd like.

Step 1: Prepare for the Video

Take notes and gather any helpful household props so you are ready to film your demonstration. You will need to:

use proper technique when preparing medications for administration, including injections, oral, sublingual, inhaled, otic, ophthalmic, and topical

use proper technique when administering medications, including injections, oral, sublingual, inhaled, otic, ophthalmic, and topical

Step 2: Record Your Demonstration

Make a video recording in which you demonstrate all required information from Step 1. Check your video to make sure the audio and video are clear and easy to understand.

Submit your video to your instructor.

Updated Text: Cumulative Project: How Do You Administer Medications?

Required Materials

- Video recording device
- Various household items (optional)

You learned about how to prepare and administer medications in this unit. Now it's time to demonstrate your new knowledge. In this activity, you will create a video to model proper techniques. Of course, you will not be using real medications or asking anyone to ingest anything, but you can use household props to help in your demonstration if you'd like.

Step 1: Prepare for the Video

Take notes and gather any helpful household props so you are ready to film your demonstration. You will need to:

- use proper technique when preparing medications for administration, including injections, oral, sublingual, inhaled, otic, ophthalmic, and topical
- use oral communication to provide patient education on what you are about to do and why
- use proper technique when administering medications, including injections, oral, sublingual, inhaled, otic, ophthalmic, and topical

Step 2: Record Your Demonstration

Make a video recording in which you demonstrate all required information from Step 1. Check your video to make sure the audio and video are clear and easy to understand.

Submit your video to your instructor.

Original Text: Cumulative Project: How Do You Take a Blood Sample?

Required Materials

Word processing software

Taking a blood sample requires several precise steps that protect both you and the patient. To help remember these steps, you will create a checklist of what needs to be done. You will also create a label for a lab specimen so you can remember all the proper documentation that needs to take place each time you collect a specimen.

Step 1: Create a Checklist

Create a checklist of the steps of taking a blood sample.

Be sure to start with PPE. Apply your knowledge of PPE used in various situations such as venipuncture and other types of specimen collection to describe what you would need to do when taking a blood sample. What steps will you add to your checklist to make sure you are using PPE accurately?

Continue on with the other steps you would take in this process of collecting a blood sample.

Step 2: Create a Sample Label

Design a sample label that you can use as a model for future specimens. Demonstrate proper labeling of lab specimens, including patient name, date of birth, source, date, time, and initials of collector.

Submit your checklist and your sample label to your instructor.

Updated Text: Cumulative Project: How Do You Take a Blood Sample?

Required Materials

Taking a blood sample requires several precise steps that protect both you and the patient. To help remember these steps, you will create a checklist of what needs to be done. You will also create a label for a lab specimen so you can remember all the proper documentation that needs to take place each time you collect a specimen.

Step 1: Create a Checklist

Create a checklist of the steps of taking a blood sample.

Be sure to start with PPE. Apply your knowledge of PPE used in various situations such as venipuncture and other types of specimen collection to describe what you would need to do when taking a blood sample. What steps will you add to your checklist to make sure you are using PPE accurately?

Continue on with the other steps you would take in this process of collecting a blood sample.

Step 2: Create a Sample Label

Design a sample label that you can use as a model for future specimens. Demonstrate proper labeling of lab specimens, including patient name, date of birth, source, date, time, and initials of collector.

Step 3: Leave Some Instructions

Finally, create a note for your coworkers with instructions on how they should properly transfer and store these lab

specimens. Make sure to be clear in your instructions, as a sample that has not been properly transferred or stored will not yield accurate results.

Submit your checklist and your sample label to your instructor.

Original Text: How Do You Read a Patient's Health Status?

Required Materials

Word processing software

Video recording device

Being able to read and interpret a patient's chart is critical in any healthcare position. This activity gives you the chance to practice this important skill.

Step 1: Read the Case Study

A patient presents to the ER with C/O HA and LBP. The patient has a h/o neuropathy and hypopnea. She currently has no N/V and VSS. After UA is performed, it is determined the patient has a UTI and will be prescribed cap to be taken t.i.d.

Step 2: Interpret the Case Study

Decipher the patient's condition and history based on your knowledge of word parts and abbreviations.

Using a medical dictionary, look up any medical conditions to ensure your definition matches the official definition and check the pronunciation of terms.

Rewrite the passage using no abbreviations to explain the diseases.

Step 3: Make a Video

Make a video of yourself relaying the information to a coworker in layperson's terms. Videos should also clearly display professionalism by speaking in a clear and respectful manner.

Submit your written description and your video.

Updated Text: Complete all components in the activity below according to the given instructions. Refer to the provided rubric for information on how you will be graded. Submit your work as a file attachment using the dropbox.

The activity is worth 15 points.

How Do You Read a Patient's Health Status?

Required Materials

Original Text: Translate the following notes from a urologist using correct medical terminology and abbreviations.

The patient today is a 68-year-old male. His past medical history includes condyloma, hypertension, diabetes mellitus, hyperlipidemia, chronic obstructive pulmonary disease. His current medications include: Metoprolol 100 mg twice a day, Diltiazem 120 mg one daily, Hydrocodone 10/500 mg as needed, Pravastatin 40 mg every morning, Lisinopril 20 mg a day at bedtime, Hydrochlorothiazide 25 mg one by mouth daily. His vitals are as follows: Temperature is 96.7, blood pressure is 108/57, pulse is 75, and weight of 193.8 pounds. He is here today complaining of blood in his urine. I ordered labs done; his creatinine levels are 2.38 with BUN of 42. Urinalysis shows blood in the urine. CT scan shows left kidney atrophy and a 3.1 cm adrenal nodule. Bilateral retrograde pyelograms and cystoscopy with biopsy performed. Biopsy confirms presence of cancer. My impression is that the patient has bladder cancer, Stage 1. Follow protocol, schedule complete transurethral resection of the bladder tumor with chemotherapy to follow.

Updated Text: Complete all components in the activity below according to the given instructions. Refer to the provided rubric for information on how you will be graded. Submit your work as a file attachment using the dropbox.

The activity is worth 15 points.

What Do I Want to Learn?

Required Materials

- Word processing software
- Graphic design software (optional)
- Audio recording device (optional)

Congratulations on starting your journey! Before you get going, it is time to take a few moments to reflect.

Step 1: Give It Some Thought

Think about your personal experience as you consider these questions:

Reflection 1: What do I already know about medical terminology?

Reflection 2: How can I use prior knowledge and experiences to understand the meaning of terms as they relate to the health science industry?

Reflection 3: What would I like to know about medical terminology?

Reflection 4: What resources and activities can help me find answers?

Step 2: Record Your Ideas

Now that you've taken some time to consider the reflection questions, record them in some way so that you will be able to look back later in the course. You may decide to write your thoughts in journal form on a word processing document, create a digital mind map of ideas, or even record an audio of your answers. This is your journey so organize your thoughts in whatever way you find most interesting.

Original Text: How Does the Digestive System Work?

Required Materials

Video recording device

Graphic design software (optional)

To understand how to treat issues with the digestive system, we first must understand how the digestive system works. In this activity, you will research and create a short video presentation designed to teach incoming students a basic overview of the digestive system's process.

Step 1: Find a Diagram

You should include at least one diagram or graphic to point to while explaining the digestive process. Look for a diagram online that can help you in your video presentation or create one using graphic design software.

You can find your own diagrams of the digestive system, or here are some online resources where you may find help:

National Institute of Digestive Diseases

Kids Health

Cleveland Clinic

Step 2: Prepare for your Video Presentation

Organize your thoughts before you present and record. Keep the following in mind:

Be sure to incorporate the following important parts of the digestive system in your presentation: tongue, esophagus, stomach, pancreas, liver, gallbladder, small intestine, large intestine, and rectum.

You will record yourself explaining what happens as food enters the body, where it travels, how the organs of the digestive system work together to break down the food and absorb nutrients, and then the path that waste takes out of the body.

Use correct medical terms for the organs, but use layperson's terms to describe the process so that your audience will understand.

Step 3: Record your Presentation

Your video should be at least two minutes in length. During your video, speak professionally and clearly so that new medical students could understand your information.

Updated Text: Complete all components in the activity below according to the given instructions. Refer to the provided rubric for information on how you will be graded. Submit your work as a file attachment using the dropbox.

The activity is worth 15 points.

Original Text: What Are the Pathophysiological Mechanisms?

Required Materials

Word processing software

In the last unit, you chose and researched a second condition so that by the end of this course you can choose one of the two conditions to create a seminar about. In this activity, you'll be building on your knowledge of the condition that you began researching in Unit 5.

Step 1: Choose Signs and Symptoms

Recall what you learned about your chosen condition from Unit 5 and think about the signs and symptoms of that condition. Then, choose THREE or FOUR of those signs and/or symptoms to research.

Step 2: Research the Signs and Symptoms

Once you have chosen three or four signs and/or symptoms to research, use credible sources to answer the following questions in a word-processing document:

What parts of the anatomy are involved in these signs and symptoms?

What is the normal function/job of this anatomical part?

What is happening on a cellular, tissue, or organ system level that causes these changes in the patient?

Are there other parts of the body affected by the changes caused by this condition?

How do the pathophysiological processes cause the presentation of this condition?

How would you explain these changes in language a patient would understand?

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 3514 of 3538

Step 3: Cite Your Sources

When you upload your word-processing document from Step 2 to your instructor, be sure to include your sources.

Updated Text: What Are the Pathophysiological Mechanisms?

Required Materials

- Word processing software

In the last unit, you chose and researched a second condition so that by the end of this course you can choose one of the two conditions to create a seminar about. In this activity, you'll be building on your knowledge of the condition that you began researching in Unit 5.

Step 1: Choose Signs and Symptoms

Recall what you learned about your chosen condition from Unit 5 and think about the signs and symptoms of that condition. Then, choose THREE or FOUR of those signs and/or symptoms to research.

Step 2: Research the Signs and Symptoms

Once you have chosen three or four signs and/or symptoms to research, use credible sources to answer the following questions in a word-processing document:

- What parts of the anatomy are involved in these signs and symptoms?
- What is the normal function/job of this anatomical part?
- What is happening on a cellular, tissue, or organ system level that causes these changes in the patient?
- Are there other parts of the body affected by the changes caused by this condition?
- How do the pathophysiological processes cause the presentation of this condition?
- How would you explain these changes in language a patient would understand?

Step 3: Create a Lab Report

Using some of the quantitative and qualitative data you collected about the disease, organize your data and create a lab report that shows what a lab technician might expect to see on test results for a patient with this condition.

Step 4: Cite Your Sources

When you upload your word-processing document from Step 2 and your lab report from Step 3 to your instructor, be sure to include your sources.

Original Text: What Contributes to Disease?

Required Materials

Word processing software

Art supplies (optional)

Graphic design software (optional)

You have been hired to create a brochure to teach the community about factors that contribute to disease. Let's see what you find!

Step 1: Consider Diseases

Thinking back to what you've learned in this unit and previous ones, create a list of at least FIVE different diseases or conditions that may affect someone.

Step 2: Investigate a Disease and Its Factors

Choose ONE of the diseases from your list in Step 1 to investigate factors that contribute to it, including age, gender, environment, lifestyle, and heredity. Using credible sources, answer the following questions:

What factors contribute to this disease? Explain.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

How many people in the United States are affected by this disease? How many people are affected because of the various factors? Explain.

What actions, if any, can someone take to prevent this disease?

What resources are available for those affected by this disease?

Step 3: Create a Brochure

Using the researched information from Step 2, create a brochure that informs people in your community about this disease and its contributing factors. Your brochure may be completed with various art supplies or you may design it using digital software. Either way, your brochure should contain both written information and illustrations.

Step 4: What to Submit

Submit the following to your instructor:

Your list from Step 1

Your answers from Step 2

Your brochure from Step 3

Updated Text: What Contributes to Disease?

Required Materials

- Word processing software

Original Text: What Are the Differences Between HAIs and Community-Acquired Infections?

Required Materials

Word processing software

In this activity, you'll gather detailed information about nosocomial infections, also known as hospital-acquired infections (HAIs). You'll then research community-acquired infections and write a summary that compares and contrasts the two types of infection.

Step 1: Conduct Research on HAIs

Review the information presented in your lessons and conduct additional research online. Gather information typical to nosocomial infection: What is a nosocomial infection? Who is at risk?

Record your findings in a word processing document. Include two to three sentences of information for each of the following bullet points, and remember to include your sources for any facts or information you present.

Causes of nosocomial infections

Prevention methods

Societal and personal impacts

Step 2: Conduct Research on Community-Acquired Infections

Now, review the information presented in your lessons and conduct additional research online about community-acquired infections. What is a community-acquired infection? Detail the re-emergence of diseases such as malaria, tuberculosis, polio, and measles.

Record your findings in a word processing document. Include two to three sentences of information for each of the following bullet points, and include your sources for any facts or information you present.

Causes of community-acquired infections

Prevention methods

Societal and personal impacts

Step 3: Compare, Contrast, Summarize

Now, analyze the information you've gathered and write a two-three paragraph summary of the main differences and any similarities between the two types of infection. Include your sources for any facts or information you present.

Updated Text: What Are the Differences Between HAIs and Community-Acquired Infections?

Required Materials

- Word processing software

In this unit, you considered how important asepsis is and how a lack of it can cause dangerous microorganisms to spread into the community. In this activity, you'll gather detailed information about nosocomial infections, also known as hospital-acquired infections (HAIs). You'll then research community-acquired infections and write a summary that compares and contrasts the two types of infection.

Step 1: Conduct Research on HAIs

Review the information presented in your lessons and conduct additional research online. Gather information typical to nosocomial infection: What is a nosocomial infection? Who is at risk?

Record your findings in a word processing document. Include two to three sentences of information for each of the following bullet points, and remember to include your sources for any facts or information you present.

- Causes of nosocomial infections
- Prevention methods
- Societal and personal impacts

Step 2: Conduct Research on Community-Acquired Infections

Now, review the information presented in your lessons and conduct additional research online about community-acquired infections. What is a community-acquired infection? Detail the re-emergence of diseases such as malaria, tuberculosis, polio, and measles.

Record your findings in a word processing document. Include two to three sentences of information for each of the following bullet points, and include your sources for any facts or information you present.

- Causes of community-acquired infections
- Prevention methods
- Societal and personal impacts

Step 3: Compare, Contrast, Summarize

Now, analyze the information you've gathered and write a two-three paragraph summary of the main differences and any similarities between the two types of infection. In your summary, use some of the quantitative data about both types that you collected. Evaluate and discuss how each of these infections can affect public health and what important principle must be followed to prevent them. Include your sources for any facts or information you present.

Original Text: Cumulative Project: How Do I Present My Findings?

Required Materials

Scientific notebook

Presentation software

Video recording device

Graphic design software (optional)

Art supplies (optional)

Poster board (optional)

Word processing software (optional)

Congratulations on completing your research study! Now you are going to document what you've accomplished by creating a video or audio presentation to communicate your process. This presentation will be designed to show your discovery to a specific group- someone who might really benefit from your findings!

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Step 1: Review Your Research

Return to your cumulative project folder and review your previous submissions. This is your last opportunity to gain new insights about your research efforts. Be sure to review:

The scientific journal you developed in Units 3 and 4

The presentation you developed in Unit 6

The reviewer feedback you received in Unit 7

Step 2: Brainstorm to Find an Authentic Audience

Thinking about what your research idea was and what you discovered, ask yourself:

Who would benefit from this information?

Who would be stakeholders in my discovery?

For example, did you research behaviors of a pet, how long food lasts in the refrigerator, or changes in nature around where you live? Here are some examples of how you might communicate those specific findings:

Could a pet product company create something, like a new pet toy, based on your research?

Would special groups in your community benefit from knowing how long it's safe to keep certain foods in the fridge?

Have there been changes in nature where you live? Is there a community group or community center where you might present the issue to interested persons?

Put some thought into who you might share your findings with and once you decide, move on to create your presentation!

Step 3: Create Your Presentation

Next, using presentation software, graphic design software or a posterboard and art supplies, create a presentation that showcases your study project. Be sure you include information on these five sections:

Your study topic, initial observations, and initial hypothesis

Any changes or edits you made to your initial hypothesis

An analysis of your data. Remember to highlight:

The statistical concepts relevant to your analysis

Any patterns you identified

Any sources of error found

Any limitations to the design of your investigation

Your model or graphic organizer

Your proven or unproven hypothesis

Step 4: Present Your Findings

Using a video recording device, showcase your presentation to your audience. Walk them through your presentation and explain why you believe they might be interested in your study. Your video should be about three to five minutes long.

Step 5: What to Submit

For your final project, upload these deliverables:

Digital presentation or poster board of study

Video recording of presentation to stakeholders

Updated Text: Cumulative Project: How Do I Present My Findings?

Original Text: The Art of Communication

Communication essentially involves three components. The first is the message—the content that is being sent between the people. The second component is the sender, who sends the message. Lastly, there is the receiver, who receives the message. Commonly, we may think of the message as an idea that the sender has and language is used to relay it to the receiver. In actuality, there are far more messages being sent between people, besides just those that are carried by verbal or written language. In other words, it is not what you say but how you say it.

Nonverbal Communication

Among other her skills, Dr. Lim is a seasoned communicator. She knows that communicating effectively with patients takes finesse and skill. You accompany Dr. Lim when she meets with Henry to discuss his diagnosis of diabetes. Receiving a diagnosis is often difficult for a patient. They may be upset or worried. They may be fearful or angry.

Overall, it is a difficult, but successful, interaction. Dr. Lim gives Henry time to reach a point of understanding. She gives him many opportunities to ask questions. At the end of the interactions, she has him repeat the most important points from their conversation.

After Henry leaves the clinic, you ask Dr. Lim if the interactions always go like this. She smiles and says no. Emotions can influence not only the nonverbal ways we communicate but the style in which we communicate verbally as well. We have all experienced people saying things they don't mean. Instead of taking another's comments personally, healthcare providers try to look beyond the words to the core of what the person is experiencing. Awareness of the patient's or other person's emotional state and mindset is essential for proper communication.

Doctor wearing a face mask meets with a patient also wearing a face mask, pointing to a monitor displaying test results and diagrams that the patient follows with their eyes.

Good communication relies upon understanding and empathy.

Communicating any kind of life-changing news makes for a delicate situation. The goal for the healthcare provider in these scenarios is to send two messages: confidence and caring. The use of body language, or nonverbal communication styles, is how these messages are sent to the receiver. As you watch Dr. Lim talk with Henry you observe many different types of nonverbal communication. The information Dr. Lim delivers in this oral report about the diagnosis is clear, but she is compassionate. She summarizes the findings, tests, and results from the clinical examination and offers words of support to Henry as needed.

Once Henry seems to be over the initial shock of hearing his diagnosis, Dr. Lim uses additional materials to help explain the condition. Using labeled drawings, she explains how the amount of sugar in the blood can influence the other functions of the body. She connects Henry's symptoms and the data from the blood work to help him understand.

Updated Text: The Art of Communication

Communication essentially involves three components. The first is the message—the content that is being sent between the people. The second component is the sender, who sends the message. Lastly, there is the receiver, who receives the message. Commonly, we may think of the message as an idea that the sender has and language is used to relay it to the receiver. In actuality, there are far more messages being sent between people, besides just those that are carried by verbal or written language. In other words, it is not what you say but how you say it.

Providing Oral Reports to Patients

Among other her skills, Dr. Lim is a seasoned communicator. She knows that communicating effectively with patients takes finesse and skill. You accompany Dr. Lim when she meets with Henry to discuss his diagnosis of diabetes. Receiving a diagnosis is often difficult for a patient. They may be upset or worried. They may be fearful or angry.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Good communication relies upon understanding and empathy.

Communicating any kind of life-changing news makes for a delicate situation. The goal for the healthcare provider in these scenarios is to send two messages: confidence and caring. The use of body language, or nonverbal communication styles, is how these messages are sent to the receiver. As you watch Dr. Lim talk with Henry you observe many different types of nonverbal communication.

Oculesics

This means eye contact. Dr. Lim makes gentle eye contact with Henry.

Posture

Dr. Lim is sitting across from Henry. She leans slightly towards him as she explains his diagnosis.

Kinesics

Body motion includes facial expressions. Henry's face becomes slightly red and a slight frown crosses his face when he hears the news.

Haptics

This involves touching. Dr. Lim places her hand gently on Henry's arm as she explains the treatments that are available to him.

Sound Symbols

These include non-verbal sounds. Henry lets out a long sigh and clears his throat before asking a question.

The information Dr. Lim summarizes and delivers in this oral report about the diagnosis is clear, but she is compassionate. She summarizes the findings, tests, and results which include both qualitative and quantitative data from the clinical examination and offers words of support to Henry as needed.

Once Henry seems to be over the initial shock of hearing his diagnosis, Dr. Lim uses additional materials to help explain the condition. Using labeled drawings, she explains how the amount of sugar in the blood can influence the other functions of the body. She connects Henry's symptoms and the data from the blood work to help him understand.

How Has the Use of Anabolic Steroids Evolved?

Required Materials

Word processing software

Art supplies (optional)

Graphic design software (optional)

In this unit, you learned that testosterone, the first exogenous anabolic hormone, was originally made in Germany in 1935 to treat depression. Since then, though, many people, including professional athletes, have used anabolic steroids to increase their competitive abilities. But how did this substance evolve from being used for one treatment to being used for another purpose? In this activity, you'll research and outline the timeline of this evolution.

Step 1: Research the History

Take some time to research the evolution of the use of exogenous anabolic steroids. As you research, jot notes down in a word processing document or scratch paper, focusing on the following:

What are some anabolic steroids that athletes use today?

When were those anabolic steroids first made, and what was their original purpose?

When do we see record of people using these anabolic steroids for other purposes than their initial intended purposes?

What are some noteworthy instances of athletes using these exogenous anabolic steroids?

Proclamation 2024: Report of Editorial Changes (11/08/2023)

What are the ethical implications of exogenous anabolic steroid use? How has that changed over time?

Step 2: Create a Timeline

With the information that you researched in Step 1, create a timeline that outlines the evolution of the use of various exogenous anabolic steroids. You may choose to create your timeline using art supplies or graphic design software.

Step 3: What to Submit

Submit your notes from Step 1 and your timeline from Step 2 to your instructor."

Updated Text: How Has the Use of Anabolic Steroids Evolved?

Required Materials

- Word processing software
- Art supplies (optional)
- Graphic design software (optional)

In this unit, you learned that testosterone, the first exogenous anabolic hormone, was originally made in Germany in 1935 to treat depression. Since then, though, many people, including professional athletes, have used anabolic steroids to increase their competitive abilities. But how did this substance evolve from being used for one treatment to being used for another purpose? In this activity, you'll research and outline the timeline of this evolution.

Step 1: Research the History

Take some time to research the evolution of the use of exogenous anabolic steroids. As you research, jot notes down in a word processing document or scratch paper, focusing on the following:

- What are some anabolic steroids that athletes use today?
- When were those anabolic steroids first made, and what was their original purpose?
- When do we see record of people using these anabolic steroids for other purposes than their initial intended purposes?

Original Text: Hospitals and Infections
Nosocomial Infections

As you know, hospital-acquired infections are any infection that spreads in the healthcare setting. Nosocomial infections are another name for this type of infection. Certain pathogens are typical agents of nosocomial infections.

Two surgeons and an assistant dressed in full PPE, consisting of hair covering, face mask, gown, and gloves, operate on a patient, all equipment covered with plastic to prevent contamination.

A hospital acts as a hub for pathogens to spread due to the invasive nature of some procedures and the frequency in which various infections are treated, encouraging mutations and adaptations to occur despite the best preventive measures. Photo by John Asselin for the U.S. Air Force, public domain.

Some of the common ones include:

Clostridioides difficile (C. Diff): a bacteria that causes diarrhea and inflammation of the lower intestines

Hepatitis viruses: commonly spread through blood and needle contact and cause inflammation of the liver

Methicillin-resistant Staphylococcus aureus (MRSA): the previously discussed antibiotic-resistant bacteria that cause skin infections

Norovirus: viruses that cause inflammation of the stomach and intestines and which can be severe in young, old, and medically compromised patients

Mycobacterium tuberculosis: bacterial cause of tuberculosis (TB), an infection of the lungs that can also enter the bones. HAIs are also linked to health care because there are specific medical procedures that are only done in those settings and certain types of infections are associated with certain medical procedures. Recall the parts of the chain of infection and note how they relate to these infections.

Updated Text: Hospitals and Infections
Nosocomial Infections

As you know, hospital-acquired infections are any infection that spreads in the healthcare setting. Nosocomial infections are another name for this type of infection. These types of infections are a serious threat to public health because they can spread from patient to patient in a hospital or from caregivers to patients. There are certain pathogens that are typical agents of nosocomial infections.

A hospital acts as a hub for pathogens to spread due to the invasive nature of some procedures and the frequency in which various infections are treated, encouraging mutations and adaptations to occur despite the best preventive measures. Photo by John Asselin for the U.S. Air Force, public domain.

Some of the common ones include:

- Clostridioides difficile (C. Diff): a bacteria that causes diarrhea and inflammation of the lower intestines
- Hepatitis viruses: commonly spread through blood and needle contact and cause inflammation of the liver
- Methicillin-resistant Staphylococcus aureus (MRSA): the previously discussed antibiotic-resistant bacteria that cause skin infections
- Norovirus: viruses that cause inflammation of the stomach and intestines and which can be severe in young, old, and medically compromised patients
- Mycobacterium tuberculosis: bacterial cause of tuberculosis (TB), an infection of the lungs that can also enter the bones.

HAIs are also linked to health care because there are specific medical procedures that are only done in those settings and certain types of infections are associated with certain medical procedures. That is why it is so important to maintain asepsis when performing them. Recall the parts of the chain of infection and note how they relate to these infections.

Note that sometimes these procedures take place outside the physical walls of a medical location; this does not change the classification. For example, a nurse inserting a catheter for a patient at their home is still conducting a medical procedure. These procedures are often necessary and lifesaving; their benefits outweigh the risks. Adoption of specific

Proclamation 2024: Report of Editorial Changes (11/08/2023)

practices further lowers these risks of infection.
