Page 932 of 3538

Why do you think a duck is able to both swim and walk? (question/answer)

(Missing part of Activity 4)

Updated Text: (Activity 1 Formative Assessment)

Have students grade themselves by using the Questioning Rubric to check for understanding and proficiency of the success criteria.

(Added to Activity 2)

Reflect and Connect question & answer not in the Answer Key. Add the following:

Reflect & Connect: How does the external structure of the beak help ducks eat their food? Because the beak is wide, ducks are able to eat larger foods. The edge of the ducks mouth is sensitive, which helps them determine what to eat and what not to. There is a hard tip that helps ducks eat anything that might be hard to eat.

(Removed from Activity 3 "Why do you think a duck is able to both swim and walk?" question/answer)

(Activity 4: Added the following to the answer key)

"How does a duck's ability to fly help it survive in its environment?" Flight helps ducks to survive because this ability helps them escape from predators and move when the environment changes.

Page 934 of 3538

Updated Text: (Activity 2 chart fixed) more force, less force (Added to Activity 3) How is mechanical energy related to a race car? A race car has mechanical energy when it moves. How can mechanical energy be provided to the car, besides a motor? Answers will vary but could include: pushing or pulling the car could provide the car with mechanical energy. What will happen if different amounts of mechanical energy are applied to a car? The amount of mechanical energy determines the speed of the car (Activity 4: Removed How is mechanical energy related to the movement of a windmill?) (Activity 5: Removed: Formative Assessment Type/ Description from TE/ Feedback: Feedback Option Feedback goes here.)

Properties of the Soil

Soil can be described by its physical properties.

These include soil color, texture, moisture, and composition. Soil can be brown, white, black, gray, and pink. It can also be all sorts of color shades in between. A soil's texture can be hard, soft, stony, or spongy. It could also be lumpy and sticky, fine, or even gritty. A soil's moisture refers to how well it

holds on to water. Some soils allow water to go right through them. Others hardly let water through. This can affect the types of plants that will grow there. Finally, a soil's composition refers to what the soil is made of. Are there rocks, nutrients, minerals, water, air, clay, or dead and decaying matter in the soil? Different soils have different things mixed with them. What are your initial observations?

What color is the soil?

Describe the soil's texture with descriptive words.

Pour water on the soil. What happens? What does this tell you about the soil's moisture?

Use a hand lens to determine what you see in the soil, such as rocks, dead or decaying matter,
Soil Scientist Interviews

A soil scientist is someone who studies soil. Julie Howe and Jake Mowrer are both soil scientists at Texas A&M. Mowrer works in Texas A&M's AgriLife Extension program. This program provides training, publications, apps, and programs. It brings Texans the latest research in agriculture and life sciences. Mowrer travels around the state to share soil and water science education and outreach. He reaches a diverse spectrum of Texans. He also works on campus with students to provide hands-on learning experiences in the greenhouse, field, and laboratory. Howe works as a professor of soil science for Texas A&M. She spends her days doing research as well as teaching. Her focus is researching better ways to produce crops. When asked what their favorite part of their jobs is,

they both replied that they love that this job gives them the opportunity to help society. Mowrer feels like the knowledge he provides to the people of Texas makes Texas a better place. Howe replied, "I love talking science and showing people how cool soil is."

Location: Unit Column

Original Text: Unit 1 - The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

Scientific and engineering practices. The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

Updated Text: Unit 1 - The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

Scientific and engineering practices. The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society. The student understands that recurring themes and concepts provide a

framework for making connections across disciplines. Note: Content for TEKS 1 to 5 appears within all other Units. Examples are provided in the Texas Essential Knowledge and Skills section and detailed in correlations.

Original Text: N/A

Updated Text: Idea Boxes Idea boxes placed throughout the chapter text function to provide opportunities for collaborative discussion of content, review of content introduced, and focus on certain content that is harder to grasp. Guidance on how to use the idea boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by: • Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support). • Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box. • Planning to have at hand any materials needed to implement the Idea box. • Reviewing the task information contained within the Idea boxes.

Original Text: Renewable resources may also appear to be universally environmentally friendly. However, they are not a perfect solution in all environments. While hydroelectric energy does not generally contaminate the environment, the building of the dam can change and harm existing ecosystems. Putting large wind turbines into an existing ecosystem can also disrupt the habitat. Every source of energy has an environmental impact; however, renewable resources tend to be easier on the environment than nonrenewable resources are.

Original Text: List of student expectations

Updated Text: Updated section titled "Alignment with Science TEKS. These changes are:

1. Separate single list into 3 separate tables. First table is for science and engineering practice TEKS. Second table is for recurring theme TEKS. Third table is for content TEKS.
2. Inclusion of an explanation of each student expectation in the column titled "Explanation of the TEKS." Click the URL for Updated Text (make sure to sign into ADI Review Site First: Password is ADITEARev2024!). Download PDF file under heading "Investigation Standards PDF." Open the file. New content is under the heading "Alignment with Science TEKS."
3. Added a column titled "Focus" indicating if this is the first time students are learning the student expectation or if it is a re-introduction of the student expectation.
4. Added 2 columns on vertical alignment. One column is for grade 3 TEKS and one column is for Grade 5 TEKS.

Original Text: List of student expectations

Updated Text: Updated section titled "Alignment with Science TEKS. These changes are:

1. Separate single list into 3 separate tables. First table is for science and engineering practice TEKS. Second table is for recurring theme TEKS. Third table is for content TEKS.
2. Inclusion of an explanation of each student expectation in the column titled "Explanation of the TEKS." Click the URL for Updated Text (make sure to sign into ADI Review Site First: Password is ADITEARev2024!). Download PDF file under heading "Investigation Standards PDF." Open the file. New content is under the heading "Alignment with Science TEKS."
3. Added a column titled "Focus" indicating if this is the first time students are learning the student expectation or if it is a re-introduction of the student expectation.
4. Added 2 columns on vertical alignment. One column is for grade 3 TEKS and one column is for Grade 5 TEKS.

Original Text: Follow all class safety rules as you carry out your plan. In addition, be sure to:

- Wear sanitized safety goggles during setup, while collecting data, and when you clean up.
- Wash your hands with soap and water when you are done cleaning up.

Updated Text: Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Handle glass with care. Always wear gloves, a lab coat/apron, and safety goggles when handling glass materials.
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Let your teacher know if any materials got broken during your investigation. Do not touch broken glass.
- Return your supplies to the supply area.
- Return your safety goggles to the place where they are stored in your classroom.

- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Let your teacher know if any materials got broken during your investigation. Do not touch broken glass.
- Return your supplies to the supply area.

- Return your safety goggles to the place where they are stored in your classroom.

Original Text: Follow all class safety rules as you carry out your plan. In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Do not eat the brown sugar or chocolate chips. These materials are used for modeling the Earth's processes.

Updated Text: Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Keep your eyes safe! Always wear safety goggles when sand/powder is present in the work area.
- Do not eat the brown sugar or chocolate chips. These materials are used for modeling the Earth's processes.
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Return your supplies to the supply area.

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:
The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Original Text: Progress check

Updated Text: Updated the third activity of the reflect stage in the following ways:

1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Original Text: Progress check

Updated Text: Updated the third activity of the reflect stage in the following ways:

1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:

The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. 1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:

The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:
The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Original Text: Progress check

Updated Text: Updated the third activity of the reflect stage in the following ways:

1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science

Proclamation 2024: Report of Editorial Changes (11/08/2023)

TEKS.

4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: You are now ready to write a report to share what you did and what you figured out during this investigation. Your report can be no longer than two pages in length. You need to divide your report into three sections:

Introduction—this is where you need to tell the reader what you were trying to figure out and why.

Method—this is where you need to describe what you did to answer the guiding question and why.

Argument—this is where you need to share what you figured out through an evidence-based argument.

You can write a draft of your investigation report on your handout or in a new Google Docs or Microsoft Word file.

In your report, you want to demonstrate your understanding about how to model slow changes to Earth's surface caused by weathering from ice, how to describe slow changes to Earth's surface caused by weathering from ice, how to explain how factors or conditions impact stability in objects, and how to explain how factors or conditions impact change in objects. You also want to describe the scientific practices, such as develop and use models. Finally, you also want to include what you know about stability and change.

You also want to make sure to use any of the unfamiliar words that you circled and defined from earlier in the investigation. You also may want to use any important vocabulary words from the readings earlier in this investigation. If your class has a word wall or you keep a list of new words in your notebook, check to see if you can use any of those words when you are writing your draft report.

When you are finished writing, let your teacher know that you are ready to move on to the next activity.

Original Text: The ADI instructional model (Sampson et al., 2009, 2011, 2014, 2015; Sampson & Gleim, 2009; Sampson & Walker, 2012; Walker et al., 2011) was created using the most up-to-date findings on learning and then tested and refined through university-based research in partnership with school districts throughout Texas. As part of this development process, the instructional model was the focus of numerous studies (see Research on ADI) that took place in actual classrooms over a period of ten years. This instructional model is intended to serve as a guide or a template for creating meaningful, rigorous, and equitable 3D science investigations (such as the ones included in these instructional materials). When teachers use these investigations inside their classrooms, their students not only have an opportunity to learn new SCIs, RTCs, and SEPs that are found in the revised TEKS as they figure out how or why something happens,

Proclamation 2024: Report of Editorial Changes (11/08/2023)

but they are also encouraged to use SCIs, RTCs, and SEPs that they learned during prior investigations (or grades) as part of the process. Each investigation also has the following features:

Updated Text: The ADI instructional model (Sampson et al., 2009, 2011, 2014, 2015; Sampson & Gleim, 2009; Sampson & Walker, 2012; Walker et al., 2011) was first created using the most up-to-date findings about how people learn and then tested and refined over time through university-based research in partnership with school districts throughout Texas. As part of this development process, the instructional model was the focus of numerous studies (see Research on ADI) that took place in actual classrooms over a period of ten years. This instructional model is intended to serve as a guide or a template for creating meaningful, rigorous, and equitable 3D science investigations or design challenges. Original Text: This instructional model includes seven stages of classroom activity (see image below). These seven stages of the instructional model provide a structure that supports students as they investigate a phenomenon, make sense of that phenomenon, and evaluate and refine ideas, explanations, or arguments (NRC, 2012). ADI also provides an authentic context for students to develop fundamental literacy skills and to learn or apply mathematical concepts and practices. Finally, and perhaps most importantly, these investigations create a language rich learning environment that enables emerging multilingual students to acquire a new language as they learn science.

Updated Text: This instructional model includes seven stages of classroom activity (see image below). These seven stages of the instructional model provide a structure that supports students as they make sense of a phenomenon or problem, create an explanation or solution, share arguments to support the validity or acceptability of these explanations or solutions, and then refine these explanations, solutions, and arguments based on feedback (NRC, 2012). ADI also provides an authentic context for students to develop fundamental literacy skills and to learn or apply mathematical concepts and practices. Finally, and perhaps most importantly, these investigations and design challenges create a language rich learning environment that enables emerging multilingual students to acquire a new language as they learn science.

[View Updated Content](#)

Original Text: The first activity of this stage of an investigation begins with the introduction of a phenomenon to create a need for students to figure something out. A phenomenon is simply an observable event. The phenomenon will usually be in video format. Students should be encouraged to record what they noticed and wonder about the phenomenon as they watch the video introduction in the task stage handout (see image at right). The students should then be given an opportunity to share their observations and questions with the rest of the class. At this point, students are interested and want to know more about the phenomenon.

Updated Text: The first activity of this stage of an investigation begins with the introduction of a phenomenon or a problem to solve. This introduction of a phenomenon or problem at the beginning of the investigation or design challenge creates a need for students to figure something out. The phenomenon or problem to solve will usually be presented to student in video format. Students should be encouraged to record what they noticed and wonder about the phenomenon or problem as they watch the video introduction in the task stage handout (see image at right). The students should then be given an opportunity to share their observations and questions with the rest of the class. At this point, students are interested and want to know more about the phenomenon or problem.

We recommend students be given opportunities to share with the full class the things they wonder about in response to the phenomenon. These wonderings can be written on a sheet of chart paper or on the whiteboard and displayed as a Wonder Wall—a specific place to document the scientifically oriented questions students pose in response to the phenomenon. A Wonder Wall ensures that all students questions about the phenomenon are acknowledged as valid and their contributions to class discourse are valued. The Wonder Wall also provides resources for extension activities for students in the Do and Share stage.

Original Text: The students are given an opportunity to share what they already know about the phenomenon during the third activity of this stage. Students begin by drawing a picture that shows what they know about the phenomenon (or in some cases a related phenomenon that is more familiar to them). They should also be encouraged to use words to help explain their ideas or thinking as part of the picture. This activity is important because students' prior knowledge and experiences related to the phenomenon can be used as a starting point for student sense-making. Teachers can then leverage the prior knowledge and experiences of the students in their classes as a tool to help students figure out how or why something happens in the world around them. This stage also provides multiple opportunities to practice, develop, and demonstrate mastery of the following grade-level SEPs as outlined in the TEKS:

Updated Text: The students are then given an opportunity to share what they already know about the phenomenon or the problem during the third activity of this stage. Students begin by drawing a picture to illustrate what they know about the phenomenon or the problem on the task stage handout (see image at right). They should also be encouraged to use words to help explain their ideas or thinking as part of the picture.

Once all the students have drawn and labeled a picture (which is a basic conceptual model of their thinking), they should be given time to share their ideas with the other students in their group. As they share their ideas, they will start asking more questions about the phenomenon and begin to think about what else they will need to know before they will be able to answer the guiding question. Finally, each group of students should be encouraged to generate a list of at least three things that they will need to learn more about during the investigation.

Original Text: The second activity of the report stage gives students an opportunity to review the reports in pairs using the peer-review guide and teacher scoring rubric (PRG/TSR; see images below). The PRG/TSR contains specific criteria that are to be used by a pair of students as they evaluate the quality of each section of the investigation report as well as the quality of the writing. There is also space for the reviewers to provide the author with feedback about how to

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1038 of 3538

improve the report. Once a pair of students finishes reviewing a report as a team, they are given another report to review. When students are grouped together in pairs, they only need to review two different reports. Be sure to give students only 15 minutes to review each report (we recommend setting a timer to help manage time). When students are grouped into pairs and given 15 minutes to complete each review, the entire peer-review process can be completed in 30 minutes (2 different reports × 15 minutes = 30 minutes).

Updated Text: The second activity of the report stage gives students an opportunity to review the reports in pairs using the peer-review guide and teacher scoring rubric (PRG/TSR; see images below). The PRG/TSR is designed as an analytical rubric that makes the criteria for mastery of the task explicit. It contains four sections. One section focuses on the introduction of the report, one section focuses on the method, one on the argument, and one on the overall writing mechanics. Each section contains specific criteria that are unique to each section of the report. These criteria are framed as questions that can be answered with an answer of “yes” (meets expectations for that criterion), “somewhat” (approaches expectations for the criterion), or “no” (does not meet expectations for that criterion). The pair of students can simply answer each question as they evaluate the quality of each section of the report as well as the quality of the writing. There is also space for the reviewers to provide the author with feedback about how to improve the report. Educational research suggests analytical rubrics are particularly effective for promoting growth throughout the year, as the norms for what counts as quality consistently evolve with students' increased knowledge and skill. This type of rubric stands in contrast to a rubric normed against a static standard of performance. A rubric with a specific standard as the end goal cannot provide continued opportunities for growth once students meet the standard used to develop the rubric. Research also shows that analytic rubrics are effective for focusing students' attention on important questions, such as the quality of evidence, along with details such as font size, neatness, or word count. While these details are important, they tend to be the sole focus of rubrics normed against a static standard of performance.

Once a pair of students finishes reviewing a report as a team, they are given another report to review. When students are grouped together in pairs, they only need to review two different reports. Be sure to give students only 15 minutes to review each report (we recommend setting a timer to help manage time). When students are grouped into pairs and given 15 minutes to complete each review, the entire peer-review process can be completed in 30 minutes (2 different reports × 15 minutes = 30 minutes).

Link to Updated Content:

[View Updated Content](#)

Original Text: The final activity of the report stage is to revise the report. Each student is required to rewrite their report using the reviewers' comments and suggestions as a guideline. The author is also required to explain what they did to improve each section of the report in response to the reviewers' suggestions in the author response section of the PRG/TSR. Once the report is revised, it is turned in to the teacher for evaluation. The teacher can then provide a score on the PRG/TSR in the column labeled "Teacher Score" and use these ratings to assign an overall grade for the report. This approach provides all students with a chance to improve their writing mechanics and develop their reasoning and understanding of the content. This process also offers students the added benefit of reducing academic pressure by providing support in obtaining the highest possible grade for their final product.

Updated Text: The final activity of the report stage is to revise the report. Each student is required to rewrite their report using the reviewers' comments and suggestions as a guideline. The author is also required to explain what they did to improve each section of the report in response to the reviewers' suggestions in the author response section of the PRG/TSR. This approach provides all students with a chance to improve their writing mechanics and develop their reasoning and understanding of the content. This process also offers students the added benefit of reducing academic pressure by providing support in obtaining the highest possible grade for their final product. Once the report is revised, it is turned in to the teacher for evaluation. The teacher can then provide a score on the PRG/TSR in the column labeled "Teacher Score" and use these ratings to assign an overall grade for the report.

The PRG/TSR, as noted earlier, is designed to be an analytical rubric rather than a holistic one. Analytical rubrics break down the characteristics of an assignment or products into parts, allowing the scorer to itemize and define exactly what aspects are strong, and which ones need improvement (Dlugokienski & Sampson, 2008). Holistic rubrics, in contrast, often list three to five levels of performance, along with a broad description of the characteristics that define each level. The main advantage of an analytical rubric is that it provides targeted feedback to students. We take this one step further and identify the criteria that, when used together, indicates that a student can write a report to share what was figured out during an investigation using DC, RTCs, and SEPs. Thus, a score of two on each criterion (meets expectations) indicates that a student has reached a level of mastery. Each criterion is also phrased as question, rather than a description, to help facilitate scoring and reduce bias. For example, two questions that included in the PRG/TSR are, "do you think the task and the guiding question or clear?" and "Do you think the analysis of the data is correct?" Answering "yes" to one of the these questions indicates that the student meets expectations for that criterion and should be awarded a score of two. Answering "somewhat" or "partially" indicates that a student is approaching expectations for that criterion and should be awarded a score of one. Finally, answering "no" indicates that the student needs improvement or did not include that aspect of the report and should earn a score of zero. Research on this approach not only shows that both students and teachers can review/score a report accurately using the PRG/TSR, but also student's writing improves substantially over time because of what they learn from reviewing other reports and from the targeted feedback they receive on their own report from their peers and their teacher (Sampson et al., 2013; Sampson & Walker, 2012).

Original Text: Original text provides a brief introduction to the different types of assessments contained in the program.

Updated Text: Updated to this section include:

1. The relationship between educative and diagnostic assessments (p. 51).
2. A definition of conceptual understanding (p. 51). and how our assessments measure student conceptual understanding
3. A definition of mastery performance and what counts as mastery on an assessment
4. How we define mastery and measure conceptual understanding in the context of students learning the TEKS.

Original Text: The image below shows the report grading tool that is embedded into the ADI Learning Hub. To use this tool, teachers can require students to submit the final draft of their investigation report through the ADI Learning Hub. The teacher can read the reports and evaluate each section using the rubric. The teacher can also provide additional feedback to a student if needed. Once the report is graded, students can see their score and any feedback in the investigation dashboard of the ADI Learning Hub.

Updated Text: The image below shows the report grading tool that is embedded into the ADI Learning Hub. The report grading tool is the same analytical rubric that is included in the PRQ/TSR described earlier in the implementation guide. Analytical rubrics break down the characteristics of an assignment or products into parts, allowing the scorer to itemize and define exactly what aspects are strong, and which ones need improvement (Dlugokienski & Sampson, 2008). The report grading tool included specific criteria that, when used together, indicates that a student can write a report to share what was figured out during an investigation. Thus, a score of two on each criterion (meets expectations) indicates that a student has reached a level of mastery. Each criterion is also phrased as question, rather than a description, to help facilitate scoring and to reduce bias. For example, two of the questions found in the report grading tool include "do you think the task and the guiding question or clear?" or "Do you think the analysis of the data is correct?" Answering "yes" indicates that the student meets expectations for that criterion and should be given a score of 2, answering "somewhat" or "partially" indicates that a student is approaching expectations and should be given a score of 1 for that criterion. Answering "no" indicates that the student needs improvement or the student did not complete that aspect of the report and should be given a score of 0. Teachers can also recognize students who exceeded grade level expectations and award a score of 3 on a specific criterion. To use this tool, teachers can require students to submit the final draft of their investigation report through the ADI Learning Hub. The teacher can read the reports and evaluate each section using the analytical rubric. The teacher can also provide additional feedback to a student if needed. Once the report is graded, students can see their score and any feedback in the investigation dashboard of the ADI Learning Hub.

Original Text: N/A

Updated Text: Added the following Text to the Tip for In Person Lesson:

Students do not need to do a "close read" of this text or completely understand all the ideas in it before moving on to the next activity. They will be encouraged to revisit this text later in the investigation when creating their arguments and writing their reports. All students need to be able to do during this activity is to work with the other members of their group to identify one or two ideas that they think are important to keep in mind or are potentially helpful.

Within the Ideas passages, important words are bolded and defined in text. Often, the definition will be supported by images and an example. These words are good words to include on a word wall or in student vocabulary notebooks. These words are also ones you can suggest students include in their plan, argument, and report where appropriate.

There are many supports for helping students comprehend what they read already embedded into this activity (i.e., activating prior knowledge, providing a shared experience, making connections, synthesizing, and talking with peers). You might not need to provide much extra support. If you are concerned about students understanding this text because of their scores on past reading comprehension tests, you can read it out loud as they follow along. As you read the text out loud, be sure to stop at each important idea and ask the students to put a star (or other annotation) next to it in the margin of their handout. They can then discuss these ideas in their small groups.

This activity provides an opportunity for emerging multilingual students to speak using scientific vocabulary, to internalize new English words, and to build academic vocabulary. We suggest visiting with individual groups and asking students to point out important words in what they read and to define what those words mean during this stage of the investigation.

The end of this activity provides an opportunity to support emerging multilingual students learning and use of (a) basic and academic vocabulary, (b) essential language, (c) basic and scientific language structures, and (d) basic and scientific expressions. While students are talking in their small groups about what they read, you can ask emerging multilingual

students to use language they heard other students use. You can also support their learning by making sure to use targeted vocabulary and language structures while speaking to individual groups and the whole class.

Updated Text: Added the following text to the Lesson Plan:

It is important to listen to the conversations of several groups when they are talking over what they read at the end of this activity. Listening to the conversations is an opportunity for formative assessment as students are processing the readings. You should take notes on what students understand and what they remain unclear on. The final activity of this stage provides an opportunity to reteach those concepts students remain unclear about. Taking notes on student conversations will provide information on planning any reteaching that students require.

Original Text: The video you watched showed some of the many different living things that can be found in the Arctic Ocean ecosystem. All these living things need energy to survive. Your goal in this investigation is to figure out the best way to model how energy transfers into, within, and out of the organisms that are found in the Arctic Ocean ecosystem. To accomplish this goal, you will need to think about the best way to show the inputs and the outputs of energy in the Arctic Ocean ecosystem and the key processes or interactions that take place within it. The guiding question of this investigation is:

How do we best model the transfer of energy into, within, and out of the organisms that are found in the Arctic Ocean ecosystem?

Updated Text: The video you watched showed some of the many different living things that can be found in the Arctic Ocean ecosystem. All these living things need matter and energy to survive. Your goal in this investigation is to figure out the best way to model how matter and energy transfers into, within, and out of the organisms that are found in the Arctic Ocean ecosystem. To accomplish this goal, you will need to think about the best way to show the inputs and the outputs of matter and energy in the Arctic Ocean ecosystem and the key processes or interactions that take place within it. After the introduction in the interactive, have students listen to the instructions. Direct their attention to the five icons. Help students complete the following sentence frame: All of the icons represent _____ (a particular type of weathering). Ask the students to describe what each of the icons represents. Encourage students to ask a question about something in the lesson that confuses them or something they still want to learn.

Model the type of reasoning needed to complete the interactive by using sentence frames. For example, point out the image of the tree roots. Then, show students the sentence frame This photo shows so it must be an example of _____. Ask students to share orally what other inferences can be made from the interactive. Encourage students to ask a question about something in the lesson that confuses them or something they still want to learn.

Original Text: Beginning: After the introduction in the interactive, have students listen to the instructions. Direct their attention to the five photos. Help students complete the following sentence frame: All of the photos show _____ (rock or sand formations).

Intermediate: Before students drag the natural process to the resulting change to landforms, have them share with a partner what they think each set of images represents. After sharing with a partner, have them hover their mouse over the image to connect the naming of the natural process to the images.

Advanced: After the introduction in the interactive, have students listen to the instructions. Direct their attention to the five icons. Help students complete the following sentence frame: All of the icons represent _____ (a particular type of weathering). Ask the students to describe what each of the icons represents.

Advanced High: Model the type of reasoning needed to complete the interactive by using sentence frames. For example, point out the image of the tree roots. Then, show students the sentence frame This photo shows so it must be an example of _____. Ask students to share orally what other inferences can be made from the interactive.

Location: Top of page

Original Text: Tell students that most of Earth’s water is in the oceans, making the ocean an important part of the water cycle. Fill the glass jar a third of the way full of hot water. Cover the top with plastic wrap and secure with tape. Explain that the hot water represents ocean water warmed by the sun, and the plastic wrap represents the atmosphere. Put the glass in the sunlight. Once condensation appears on the inside of the glass, ask the following questions.

ASK • What do you see inside the glass jar? Sample response: I see water droplets inside the glass jar.

- What causes the water droplets? Sample response: Some of the warm water turns to water vapor and rises. When the water vapor hits the plastic at the top of the jar, it cools and changes to liquid water droplets.
- In nature, what heats the atmosphere and the ocean? Sample response: the sun

Explain that this system of a glass jar, cover, and water makes a simple model of the water cycle because it shows the interaction of the sun and the ocean. The sun warms the ocean, causing the water to evaporate into the atmosphere. Tell students that condensation occurs when water cools, changing from a gas to a liquid, from water vapor to liquid water droplets.

Provide students with the opportunity to discuss their observations and ideas. Encourage students to think with others by asking them to discuss how the water in the glass jar cycles. Then, ask students to share what they would like to know about the water cycle with the class.

Updated Text: Tell students that most of Earth’s water is in the oceans, making the ocean an important part of the water cycle. Fill a plastic cup a third of the way full of hot water. Original Text: Part 3

- What is happening to the water in each glass jar? Record and draw your observations.
- How does the amount of water that condenses inside the glass jars compare?
- Was your prediction correct? Why or why not?
- Clean up your materials and workstation.
- Use your observations and knowledge to illustrate the continuous movement of water above and on Earth's surface through the water cycle. Include the sun and arrows in your illustration.

As students investigate, circulate around the room to be sure that students are using the data collection tool appropriately.

Record your observations. Students should observe condensation on the plastic wrap of the jar that was filled with warm water, but no change in the jar that was filled with room temperature water.

Original Text: • Where in the water cycle model does water change state? Student responses will vary. Sample responses: Water changes from a liquid to gas when it moves from the ocean to the air. Water changes from a gas to a liquid when it cools and collects on the side of the jar.

- How would the model be different in polar regions with water as ice? Student responses will vary. Sample response: There would be much less condensation in a model of polar regions.
- What safety rules did you follow during the investigation? Sample response: I was careful with the warm water so that I didn't spill or drop the jar.

Original Text: ASK

How does the surface affect how friction acts on the motion of an object? Student responses will vary. Sample response: On metal and plastic, the block went fast and stopped past the middle of the track. On wood, the block traveled to the middle of the track. On rubber, the block went slow and stopped before it reached the middle of the track. The surface affects how fast the object moves and how far it travels before stopping.

What patterns of friction forces were observed? Sample response: The less smooth the surface, the less distance the block traveled before it stopped.

Updated Text: ASK

How does the surface affect how friction acts on the motion of an object? Student responses will vary. Sample response: On metal, the block went fast and stopped at the end of the track. On wood, the block traveled, and then it stopped just past the middle of the track. On sandpaper, the block went slow and stopped before it reached the middle of the track. The surface affects how fast the object moves and how far it travels before stopping.

What patterns of friction forces were observed? Sample response: The rougher the surface, the less distance the block traveled before it stopped.

Original Text: Have students Turn and Talk to discuss the following questions.

- What revisions did you make to your model? Student responses will vary. Sample response: We added arrows to show

which direction the water is moving in different parts of the cycle.

- How did these revisions improve the overall model? Student responses will vary. Sample response: The revisions helped to better show the constant movement of water. I was able to better show the different parts of the water cycle.

Updated Text: Have students Turn and Talk to discuss the following questions.

- What revisions did you make to your model? Student responses will vary. Sample response: We added arrows to show which direction the water is moving in different parts of the cycle.
- How did these revisions improve the overall model? Student responses will vary. Sample response: The revisions helped to better show the constant movement of water. I was able to better show the different parts of the water cycle.
- Do you think your model will give someone a complete, partial, or minimal understanding of the water cycle? Explain the pros and cons of your model. Sample response: My model will help someone a complete understanding because I used labels to show each step of the water cycle process. I wish the model could show real clouds.
- How well did your group use safety equipment and follow safety precautions during the investigation? Explain. Sample response: Our group did a good job because we wore closed-toe shoes, did not run with the scissors, and we used the scissors carefully.

Original Text: Have students turn and talk to a partner about the question: Can farmers rely only on rainfall for irrigation? Why or why not? Sample response: No. Rainfall can be scarce sometimes, so the plants might not get enough water. Farmers use irrigation to supply plants with adequate water.

Updated Text: Have students turn and talk to a partner about the question: How do sprinklers and irrigation work to help farmers? Why is this better than depending only upon rainfall? Sample response: Sprinklers and irrigation help farmers by bringing consistent amounts of water for their crops. This means that farmers can control how much water they are getting and not have to rely only on the chance of rain.

Original Text: • What structures did you use to classify your plants? Describe them. Student responses will vary. Sample response: We used leaves and stems to classify the plants by size, shape, and color. We also classified them by whether they had flowers that would make seeds or no flowers with spores.

• How do these structures help plants survive? Student responses will vary. Sample response: The stems transport minerals and water from the roots to the leaves. The leaves make food for the plant.

Updated Text: • What structures did you use to classify your plants? Describe them. Student responses will vary. Sample response: We used leaves and stems to classify the plants by size, shape, and color. We also classified them by whether

they had flowers that would make seeds or no flowers with spores.

- How do these structures help plants survive? Student responses will vary. Sample response: The stems transport minerals and water from the roots to the leaves. The leaves make food for the plant.
- What safety rules did you follow during the investigation? Sample response: I made sure not to touch any plants in case they were poisonous.

Component: *Science Techbook for Texas by Discovery Education: Grade 4 Unit 2 Teacher Edition*

ISBN: 9781616292188

Current Page Number(s): 33

Location: Reading Strategies > During Reading

Original Text: Have students use the graphic organizer throughout the reading lesson. For each picture, prompt students to write what they see in the middle column under Event. Then, encourage students to think about how friction is causing what they see in the picture. Next, students need to write what happened when friction acted on the object(s) in the picture. For example, the event is a child moving down a slide. Friction is causing the child to move slowly as she goes down the slide. The effect is that by the time she reaches the bottom of the slide, her motion will be slower than at the top of the slide.

Updated Text: Have students use the Bubble Map graphic organizer throughout the reading lesson. In the center circle, students should write the word Friction. During reading, prompt students to stop after each section and write some details that explain friction in the outer bubbles.

Component: *Science Techbook for Texas by Discovery Education: Grade 4 Unit 2 Teacher Edition*

Original Text: You are going to be design engineers working on the problem of creating the best parachute to return astronauts back to Earth from space. In this activity, you will be engineers that use what you know about forces and gravity to make sure your parachute can deliver astronauts safely

Updated Text: In this activity, you will be engineers! Engineers use their knowledge and skills to come up with solutions to problems by building and designing materials. You are going to be design engineers working designing a solution to the problem of creating the best parachute to safely return astronauts back to Earth from space.

You will use what you know about forces and gravity by building a model to make sure your parachute can deliver astronauts safely. Engineers make models to help them visualize, test, and refine their ideas before creating the final product. For this exercise, you must test and revise before using a parachute design with actual people. Can you find the best solution to the problem of safely returning astronauts to Earth?

Original Text: Performance Task

- Goal: Your team's task is to design a plan and build an earthworm recycling bin for classroom or home use.
- Role: You are an Earthworm Wrangler, and your team will oversee the designing and building of a home for earthworms, plus feeding and caring for the earthworms.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1099 of 3538

- Audience: Your target audience is anyone who would like to speed up the decomposition process of plant scraps in the home.
- Situation: Your team’s challenge is to demonstrate to your class and teacher that you understand what it takes to keep earthworms alive for use in recycling and composting plant waste in the classroom or at home.
- Product: Your team will develop a design for and create an earthworm composting bin that can be used in the classroom or at home for recycling.
- Success Criteria: A successful result will be when your team’s earthworm recycling bin is built and properly maintained, and earthworms stay alive and thrive in their new home.

Updated Text: Performance Task

Goal: Waste is a major problem for our Earth and composting can be a solution! Your team’s task is to design a written and illustrated plan and build an earthworm recycling bin model for classroom, home, or business use.

Role: You are an Earthworm Wrangler, and your team will oversee the designing and building of a home for earthworms, plus feeding and caring for the earthworms.

Audience: Your target audience is anyone who would like to speed up the decomposition process of plant scraps in the home.

Situation: Your team’s challenge is to demonstrate to your class and teacher that you understand what it takes to keep earthworms alive and have found a solution for waste by recycling and composting plant waste in the classroom or at home using your designed model.

Product: Your team will develop a design for and create an earthworm composting bin that can be used in the classroom or at home for recycling.

Success Criteria: A successful result will be when your team’s earthworm recycling bin is built and properly maintained, and earthworms stay alive and thrive in their new home. This bin should work at home, a school, or business.

Updated Text: Condensation happens when water vapor in the air turns back into tiny water droplets when it touches something cold. It's like when your breath fogs up a mirror – the warm air from your breath turns into little water droplets when it meets the cold mirror.

So, when warm air meets a cold surface, it changes into those little water droplets we can see. That's why you might see condensation on windows, mirrors, and even the grass in the morning when it's colder.

Updated Text: By seeing and interacting with models, you can visualize how wind can be used to lift things. Your model can be used to make connections to real-world applications. Have you seen moving wind purposefully used to do something?

Models also promote problem-solving skills. You can use models to analyze, predict, and experiment with different scenarios. Models help you apply knowledge to real-world situations. By using models to simulate and represent concepts, you can see how theoretical knowledge connects to practical applications.

After using your model to see and understand how wind can be used to do work, you will be given a challenge to change the design to allow your windmill to pick up more objects.

The problem: After viewing how your model windmill works, can you create a different design that is better at harnessing the wind? The first model can pick up a small mass, can you pick up larger masses with a different model?

Current Page Number(s): Matter (TEKS 4.6) Test A, p.5

Location: Matter (TEKS 4.6) Test A, Item 9, Question and Answer Choices E and F

Original Text: "Kelsey and Mickey wondered what would happen to different metals if they were put out in the rain. They chose two pieces of metal: one was shiny and one was dull and black. Each piece weighed 10 ounces. Every three days the girls would pour one ounce of water over each piece of metal. After five weeks, they noticed that the black metal was covered in orange-colored powder. The shiny silver piece was not. They weighed both pieces of metal at the end of five weeks. After they scraped the orange powder off, the black piece of metal weighed only 8.5 ounces."

"E. 10 ounces"

"F. 1.5 ounces"

Updated Text: "Kelsey and Mickey wondered what would happen to different metals if they were put out in the rain. They chose two pieces of metal: one was shiny and one was dull and black. Each piece weighed 283 grams. Every three days the girls would pour 28 grams of water over each piece of metal. After five weeks, they noticed that the black metal was covered in orange-colored powder. The shiny silver piece was not. They weighed both pieces of metal at the end of five weeks. After they scraped the orange powder off, the black piece of metal weighed only 241 grams.

"E. 283 grams"

"F. 42 grams."

Current Page Number(s): p. 222

Location: Differentiation: Extra Support

Original Text: "Consider setting up student "Help Stations" for peers to assist one another when creating a scale model and building. Students who are early finishers or have more knowledge of the content can serve as student helpers at the Help Station."

Updated Text: "Individual reservoirs in Texas can store millions or even billions of cubic meters of water. To help students think about scaling their solution up to a full-size reservoir, ask questions in incremental steps: How would your solution need to be different if you made it five times bigger? 10 times bigger? 100 times bigger?"

Current Page Number(s): p. 224

Location: Column 2, Do the Math, paragraph 1 and Support for Student Answers, Do the Math

Original Text: "A raindrop is many times bigger than a water droplet and a dust particle. For example, a dust particle is very small compared to a raindrop. Use the table to put the items in order and identify how much smaller a dust particle is than a raindrop.

Support for Student Answers

Do the Math: The fractions show the sizes of dust particles and droplets in relation to the size of raindrops. In the middle

column, place the fractions in order from least to greatest. Then place the items that correspond to that fraction of a raindrop's size. Answer: raindrop 1/1, large droplet 1/20, average droplet 1/100, dust particle 1/5000"

Updated Text: "Support students in ordering the fractions by size. Help students understand that larger denominators with equal numerators indicate smaller parts of a whole. Then, students can use the information from the images to match the items to their relative size.

Support for Student Answers

Do the Math: Use the table to put the items in order and identify how much smaller a dust particle is than a raindrop. The fractions show the sizes of dust particles and droplets in relation to the size of raindrops. In the middle column, place the fractions in order from least to greatest. Then place the items that correspond to that fraction of a raindrop's size.

Answer: 1/5000 dust particle, 1/100 average droplet, 1/20 large droplet, 1/1 raindrop"

Original Text: Guided Inquiry

Provide the explorable question. Ask: How can you use paper to prevent an egg from breaking when dropped?

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1153 of 3538

Example Students might design a device to catch the egg rather than designing a carrier. Investigations must answer the explorable question.

TEKS 4.1B

Updated Text: Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question. Ask: How can you use paper to prevent an egg from breaking when dropped?

Example

Step 1. Observe the materials for building a device to keep the egg from breaking when dropped from two meters. Step 2. Brainstorm what device can be made with the available materials. Step 3. Build the device. Step 4. Find an area and test the device. Step 5. Compare the design with others and think of ways to improve the design. Step 6. Repeat brainstorming and improving the design to help make the egg drop successful.

Current Page Number(s): 74B

Location: left column, Guided Inquiry

Original Text: Guided Inquiry

Provide the explorable question. Ask: How can you separate matter that has been mixed together?

Example Students might use additional tools to help separate the mixture such as cheese cloth and water to dissolve the salt. They might use a heat lamp to help evaporate the water. Investigations must answer the explorable question.

Updated Text: Structured Inquiry

Provide step-by-step instructions to help students investigate the explorable question.

Ask: How can you separate matter that is mixed together?

Step 1. Observe the mixture in the bowl and think about the physical properties of each individual substance. Step 2. Determine what tools to use to separate the mixture into individual parts. Step 3. Use tools to begin separating the mixture until all substances are separated. Step 4. Observe other groups and think about how you can improve on your design.

Component: McGraw Hill Texas Science, Grade 4 Teacher Edition

Original Text: Preview the Topic

In this topic, students learn about matter. First, in Experience 1, students classify and describe objects by properties, such as whether they sink or float in water.

Next, in Experience 2, students compare and contrast the properties of solids, liquids, and gases. Finally, in Experience 3, students demonstrate that mass is conserved when substances are mixed.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of a person shaping hot, molten glass. As students

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1175 of 3538

progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How did the glass get this shape?

Teacher Background

Watch the Teacher Background Video Matter to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- A mixture is a combination of two or more materials that are easy to identify and separate.
- A solution is a type of mixture in which one material is dissolved evenly into another material, and the materials are no longer easy to identify or separate.
- Conservation of matter means that when materials are combined, the amount of each material remains the same even if the state of matter changes.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise, and address as needed.

Common misconceptions are listed in bold type.

The subsequent text explains the misconceptions.

- **Melting** is the same as dissolving. Explain to students that melting occurs when matter changes from a solid to a liquid state as a result of heating, but dissolving occurs when one substance spreads out throughout another substance to form a solution.
- **Condensation** is water that has seeped through something. Explain that the water droplets they observe as condensation have come from water vapor in the air that has become liquid water because of a reduction in temperature.

Component: *Grade 4 Teacher Guide*

ISBN: 9781323223352

Current Page Number(s): 38

Location: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn that forces are pushes or pulls that can make things move, change direction, or change shape. First, in Experience 1, students investigate forces that act on objects through direct contact. Then in Experience 2, they explore forces that act on an object at a distance.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video of a skateboarder moving across different surfaces. As students progress through the Experiences, they will revisit the Anchoring Phenomenon question, What happens when skateboards roll across different surfaces?

Teacher Background

Watch the Teacher Background Video Force and Motion to refresh your knowledge of topic content. Key concepts to support instruction of the topic:

- Pushes, pulls, and friction are contact forces that change the position of an object through direct contact.
- Friction pushes against an object to slow it or change its direction.
- Gravity and magnetism are noncontact forces that can change the position of an object at a distance, without direct contact.
- Stronger forces have a greater effect on the motion of objects than weaker forces do.

Current Page Number(s): 56

Location: major column, starting at Guide Student Planning

Original Text: GUIDE STUDENT PLANNING Explain to students that it is useful to record their observations with detailed descriptions and drawings. This will help them analyze their results and share them with other students. Ask:

- How does your drawing help you to construct your car?
- What variable can you change?
- What do you predict will happen?

GUIDED INQUIRY PROCEDURE To support students who are having difficulty preparing their materials for investigation, prepare the base for each model car that students will decorate, and then model these steps for student groups.

1. Insert a small dowel in both the front and back of a cardboard tube, halfway between the center point and bottom of the tube when lying horizontal.
2. Using the glue gun, attach a bottle cap to each end of the dowels.
3. Glue a magnet to the inside of the lower part of the front of the cardboard tube.
4. On the end of the large dowel, use the glue gun to attach a magnet so that the end of the dowel lies on the back of the magnet.

DIFFERENTIATED INSTRUCTION

Challenge For students ready for a challenge, have them apply their observations from the STEAM Station to real-world situations. Invite students to draw diagrams showing how magnets could be used to control the movement of a monorail or rollercoaster car.

Location: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn that energy is everywhere and can be observed in cycles, patterns, and systems. First, in Experience 1, students investigate the transfer of energy by moving objects, waves in water, and sound. Next, in Experience 2, students identify conductors and insulators of heat and electrical energy. Finally, in Experience 3, students demonstrate and identify that electrical energy can produce light and thermal energy and travels in a closed path.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video about a pinball machine and then explore different conductors and insulators to explain how energy transfers in a pinball machine. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, How does energy move in pinball?

Teacher Background

Watch the Teacher Background Video Energy to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Mechanical energy can be transferred from moving objects to other objects through collisions or waves.
- A conductor is a material through which electrical energy or thermal energy can move easily. An insulator is a material through which electrical energy or thermal energy cannot move easily.
- The transfer of electrical energy in a closed path, or circuit, from a source to a device can produce light energy and thermal energy.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise, and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Sound can only travel through air.** Explain that sound waves actually travel faster through liquids and solids than through air because the particles in solids and liquids are closer together and can transmit the vibrations from sound waves more quickly.
- **Water cannot conduct electrical energy.** Explain that while pure, fresh water

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1182 of 3538

does not conduct electrical energy, salt water and most tap water and bottled water contain minerals that act as conductors.

- Objects such as blankets are sources of heat. Guide students to understand that temperature is not a property of objects. For example, a blanket and a metal pan have the same temperature under the same conditions. A blanket can keep things warm because it is an insulator that reduces the flow of thermal energy.

Updated Text: Preview the Topic

In this topic, students learn that energy is everywhere and can be observed in cycles, patterns, and systems. First, in Experience 1, students investigate the transfer of energy by moving objects, waves in water, and sound. Next, in Experience 2, students identify conductors and insulators of heat and electrical energy. Finally, in Experience 3, students demonstrate and identify that electrical energy can produce light and thermal energy and travels in a closed path.

(new second paragraph in Preview the Topic here)As you progress through the topic, connect the activities back to Topic 2, Force and Motion. Students can apply what they learned about forces (TEKS 4.7) to what they learn in Topic 3 about investigating the transfer of energy (TEKS 4.8A).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of a person shaping hot, molten glass. As students progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How did the glass get this shape?

(head)Topic Readiness Test and Remediation

Students answer questions to show what they already know about Energy by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Teacher Background

Watch the Teacher Background Video Energy to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- A conductor is a material through which electrical energy or thermal energy can move easily. An insulator is a material through which electrical energy or thermal energy cannot move easily.

Current Page Number(s): 88

Location: major column, starting at Guide Student Planning

Original Text: GUIDE STUDENT PLANNING Ensure that students are familiar with the materials provided. Guide students to understand which materials are which, so they can follow the procedure accurately. Introduce them to a battery and ensure that they know that it has a positive and a negative connector. Ask:

- Which materials are you familiar with?
- Why is it necessary to complete all steps in the procedure?
- How will you know when you have created a circuit?
- What do you predict will happen to the light when your circuit is complete?

GUIDED INQUIRY PROCEDURE If students have difficulty building their model of a circuit, lay out the materials for them in the order in which they will be used.

Then model the steps.

1. Place the light bulb in the light bulb holder.
2. Place the battery in the battery holder.
3. Connect one wire to one side of the light bulb holder.
4. Connect the other wire to the other side of the light bulb holder.
5. Connect one wire from the light bulb holder to the positive connector of the battery holder and the other wire to the negative connector.

(1 Differentiated Instruction Notes)

Updated Text: GUIDE STUDENT PLANNING Ensure that students are familiar with the materials provided. Guide students to understand which materials are which, so they can follow the procedure accurately. Introduce them to a battery and ensure that they know that it has a positive and a negative connector. If students need additional support, use this scaffolding and guidance for just-in-time learning acceleration. Ask:

- Which materials are you familiar with?

(new second Differentiated Instruction note)

CHALLENGE For students who need an additional challenge, consider asking them to draw their own open and closed circuits. Have students draw the arrows to show the flow of energy through each circuit. Ask students to determine when energy stops flowing in the open circuit.

Component: *Grade 4 Teacher Guide*

ISBN: 9781323223352

Current Page Number(s): 94

Location: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about Earth's patterns. First, in Experience 1, they investigate the seasons, explore how the tilt of Earth's axis affects the seasons, and identify seasonal patterns such changes in temperature and the amount of daylight. Then, in Experience 2, students observe and analyze the phases of the moon to recognize patterns.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video showing phases of the moon. As students progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How can you predict moon patterns?

Teacher Background

Watch the Teacher Background Video Earth and Space to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- A season is a time of year with a distinct pattern of temperature and daily sunlight.
- Earth's axis is an imaginary line from the North Pole to the South Pole through the center of Earth.
- The seasons show up differently in different parts of the world, but there are still seasonal distinctions. Places closest to the equator will experience a less drastic shift in seasons.
- Moon phases are how the moon appears to change shape based on how much of its lit surface we can observe from Earth.
- New moon, quarter moon, full moon, and third quarter moon are some wellknown moon phases.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- Seasons result from Earth's distance from the sun. Explain to students that the seasons change because of the angle of Earth's tilt on its axis. When the North Pole is tilted toward the sun, the Northern Hemisphere gets more direct sunlight than when the North Pole is tilted away from the sun.
- Earth revolves around the sun daily. Advise students that a complete revolution around the sun takes Earth one year with many days of light and nights of dark.

Updated Text: Preview the Topic

In this topic, students learn about Earth's patterns. First, in Experience 1, they investigate the seasons, explore how the tilt of Earth's axis affects the seasons, and identify seasonal patterns such changes in temperature and the amount of daylight. Then, in Experience 2, students observe and analyze the phases of the moon to recognize patterns.

(new second paragraph in Preview the Topic here)As you progress through the topic, connect the activities back to Topic 2, Forces and Motion. Students can apply what they learned about forces (TEKS 4.7) to what they learn in Topic 4 about identifying sequences and patterns in seasons (TEKS 4.9A).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of a person shaping hot, molten glass. As students progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How did the glass get this shape?

(head)Topic Readiness Test and Remediation

Students answer questions to show what they already know about Patterns on Earth by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

PREVIEW ANCHORING PHENOMENON

Students watch and respond the Anchoring Phenomenon Video of a solarpowered device and differentiate between the parts that collect energy and the parts that use energy. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, How can sunlight power devices?

Teacher Background

Watch the Teacher Background Video Patterns on Earth to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Erosion is the process by which particles are broken away and removed by water, wind, or ice.
- Deposition is the laying down of eroded particles.
- The water cycle is the way that water moves around Earth in different forms.
- Renewable resources are natural resources that cannot be used up or that can be replaced.
- Nonrenewable resources are natural resources that can be used up or that cannot be easily replaced.

Location: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about ecosystems. First, in Experience 1, students identify producers, consumers, and decomposers and explain how plants can use energy and matter to create their own food. Next, in Experience 2, students describe the cycling of matter and the flow of energy through food webs. Finally, in Experience 3, students use fossil evidence to identify and describe past environments.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of a panda eating bamboo. As students progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How does a bamboo plant make food that pandas can eat?

Teacher Background

Watch the Teacher Background Video Ecosystems to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Animals and plants play important roles in maintaining an ecosystem.
- Certain animals and plants have developed the ability to adapt and thrive in changing ecosystems. Others perish or migrate to new locations.
- Carbon dioxide is a gas in the atmosphere that plants and other producers use to make their own food.
- Food webs are systems of interconnected food chains.
- Decomposers are organisms that break down dead plant and animal matter. They use matter and energy from waste and dead organism bodies.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

As students explore the content, be attentive to common misconceptions that may arise, and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- Ecosystems do not change over time. Explain that there are several factors that cause ecosystems to change. These factors include environmental changes, such as drought or flooding, and human activity, such as clearing land for building.
- Producers are unable to defend themselves against consumers. Point out that many plants have natural defense structures, such as thorns and spikes or internal poisons intended to sicken, that protect them from consumers.
- Fossils are always the remains of an organism's body. Explain that fossils include imprints such as footprints or shapes left by the body of a plant or animal, and that all fossils provide evidence of life in the past.

Updated Text: Preview the Topic

Students watch and respond to a short Anchoring Phenomenon Video of an agave plant. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, Why does a plant have a growth spurt?

Updated Text: Preview the Topic

In this topic, students learn about organisms. First, in Experience 1, they investigate plant structure and function. Then, in Experience 2, they investigate physical traits of organisms. Students explore how different structures help organisms to survive in their environments.

(new second paragraph in Preview the Topic here)As you progress through the topic, connect the activities back to Topic 6, Interactions in Ecosystems. Students can apply what they learned about plant structures and processes (TEKS 4.12A) to what they learn in Topic 7 about how structures and functions of plants help them survive (TEKS 4.13A).

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of an agave plant. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, Why does a plant have a growth spurt?

(head)Topic Readiness Test and Remediation

Students answer questions to show what they already know about Matter by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Original Text: Make Observations To help students prepare to compare the leaf coatings by touch and sight, spray water on a paper towel. After a few minutes, spray water on a second paper towel. Ask students to describe how wet the paper towels look just by observing them.

Challenge For students who are ready for a challenge, have them wrap a leaf of a living plant in plastic wrap so that a small amount of air is trapped in the plastic wrap. Ask students to observe the plastic for several days to look for and explain any changes. Challenge students to explain the droplets that appear on the underside of the plastic wrap, conducting research to confirm their explanations.

Updated Text: STRIVING: Make Observations To help students prepare to compare the leaf coatings by touch and sight, spray water on a paper towel. After a few minutes, spray water on a second paper towel. Ask students to describe how wet the paper towels look just by observing them.

Updated Text: (added teacher instruction page, see below)

(Header) Texas Science Extension Activities

Fourth Grade: Plant Structures and Functions | Flower Dissection

(information table) Flower Dissection | Lesson Time: 45 minutes | 5E: Explain

Materials:

- flowers (one per pair of students)
 - Tip: Tulips provide external structures and internal structures for investigation. A rose could also be used.
- one piece of white paper per pair of students (for students to lay the flower on while dissecting)

- **Dissection Directions** (one per pair of students)

Lesson Guide

In this activity, students will investigate the internal and external structures of a plant through a dissection.

- Tip: The plant dissection is designed for pairs. However, it can also be done in small groups. You may also choose to do a demonstration and have the class observe the different structures. You will need to adjust the materials if you choose to use small groups or a class dissection instead.
- Allergy note: If any students are allergic to pollen, you may want to show a video of a plant dissection instead.

Location: Podcast: Studies Weekly Online, Unit 17, "Engineering Design: Producers Make Food: Topic Background Information Podcast," 1:13 - 2:53

Original Text: (Audio script)

Let's study the flow of energy through a food chain in a pond ecosystem. A common food chain includes the sun, grass, grasshoppers, frogs, and hawks. The sun provides energy to the grass. Grasshoppers eat the grass, so energy transfers from the grass to the grasshoppers. Next, frogs eat the grasshoppers, transferring energy from the grasshoppers to the frogs. Finally, hawks eat the frogs, transferring energy from the frogs to the hawks. If a food chain changes, there can be negative effects on the ecosystem. For instance, if frogs are removed from this pond's food chain, there will be no food for the hawks. The hawks will have to move to another place that has frogs. Also, there won't be frogs to eat the grasshoppers. That means the population of grasshoppers will increase, which causes more grass to get eaten.

In fourth grade, students dive deeper into organisms in environments and learn how producers make their own food. Often, producers are plants. Plants make their own food using sunlight, water, and carbon dioxide. Let's identify the important parts of a plant that allow it to make its own food. The parts include the leaves, roots, and stem. The leaves contain a chemical that absorbs sunlight. They also have tiny pores that carbon dioxide passes through. A plant's roots soak up water, and the stem transports the water to other parts of the plant. Now that you know the purpose of a plant's different structures, let's explore the process of a plant making its own food.

Updated Text: (Audio script)

Let's study the flow of energy through a food chain in a pond ecosystem. A common food chain includes the sun, grass, grasshoppers, frogs, and hawks. The sun provides energy to the grass. Grasshoppers eat the grass, so energy transfers from the grass to the grasshoppers. Next, frogs eat the grasshoppers, transferring energy from the grasshoppers to the frogs. Finally, hawks eat the frogs, transferring energy from the frogs to the hawks. If a food chain changes, there can be negative effects on the ecosystem. During science instruction at school, your child will explain the critical role of energy resources to modern life and how conservation, disposal, and recycling of natural resources impact the environment.

By the end of this unit, students should be able to meet the following learning objectives:

- I can observe graphs about energy production and use in Texas, and ask questions about what I observe and notice.
- I can explain the importance of energy resources such as natural gas to modern life by investigating the flow of energy from natural resources to household appliances.
- I can explain how the conservation of natural resources used for energy impacts the environment by investigating the flow of energy from natural resources to everyday appliances

The vocabulary terms that students need to know are:

Current Page Number(s): 3-4

Location: Printable: Studies Weekly Online, Unit 15, Activity 4, "Energy Use Game," Transportation Card #6 (pdf pg. 3), All #7 cards (pdf pg. 4)

Original Text: (Transportation card 6 is a repeat of Transportation card 4; All of the 7 cards are a repeat of the 5 cards)

Updated Text: (Transportation Card 6 was changed to the following:)

(pdf pg. 3)

Transportation

Regional (by truck)

Your object was made in another state in your region, it had to travel 600 miles by truck to reach your local store, so it used 5 gallons of gasoline per ton of cargo.

6

(Changed all 8 cards to 7 cards and added the following to the 8 cards:)

(pdf pg. 4)

Natural Resource

Metal

Pots, pans, and soda cans are made of metal, but metals such as steel, aluminum, copper, and zinc are important building blocks of our world in much bigger ways. Buildings, computers, appliances, and phones all have metals inside them!

Some metals such as copper require a lot of energy to reach it beneath the Earth's surface.

8

Manufacturing

Smelting*

Before a metal can be used in an appliance or technology, it must first be heated up to a high temperature in a process called smelting.

Due to how aluminum is found in nature, it requires more energy than copper to smelt and process before it can be used.

Object: Car part or fridge or soda can.

*CAN ONLY BE PLAYED IF YOUR NATURAL RESOURCE IS METAL

8

Transportation

International (by ship)

Your item is shipped from China to Texas in a large container ship. It has to travel over 15,000 miles, using 26 gallons of

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1233 of 3538

gas per ton of cargo. It is then transported to your local store by truck for a total of 27 gallons of gas per ton.

8

Disposal

Biomass

Your city burns trash to produce electricity. You throw your object away and energy is used to transport it to your city limits, but once it's burned, it is used to produce electricity.

*Cannot use this card if you have Oil as a Natural Resource

Original Text: 4. Have students take out their Texas Map printable5. Display the Wind Energy Potential image.6. Ask: What does this map show? (the amount of wind energy that could potentially be produced in the United States)- if necessary, explain that "potential" means this is the amount of wind energy the U.S. could produce but that it is not currently producing this much wind energy.7. Ask: Where is the most wind energy potential in the United States, according to this map? (Along the coasts and near mountains)8. Ask: Where in Texas can you produce the most wind energy? (along the southern coast and in West/Central Texas)9. Have students color in the areas of Texas where wind energy is found on their Texas maps.- Some areas might overlap with solar energy. Have students use stripes to indicate areas with more than one resource.- Be sure students label the color they used to indicate wind energy on their map key.

Updated Text:

1. Have students take out their Texas Map printable
2. Display the Texas Wind Energy Potential image.
3. Ask: What does this map show? (the amount of wind energy that could potentially be produced in Texas)
- if necessary, explain that "potential" means this is the amount of wind energy Texas could produce but that it is not currently producing this much wind energy.
4. Ask: Where in Texas can you produce the most wind energy? (along the southern coast and in West/Central Texas)
5. Have students color in the areas of Texas where wind energy is found on their Texas maps.
- Some areas might overlap with solar energy. Have students use stripes to indicate areas with more than one resource.
- Be sure students label the color they used to indicate wind energy on their map key.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1246 of 3538

Updated Text: (Added Extension Activity Header, information table, and teacher instructions, see below. Also fixed pdf pg. 2 table and deleted pdf pg. 4-5.)

(added header) Texas Science Extension Activities

Fourth Grade: Weathering, Erosion, and Deposition

(added table:)

Deposition, Lesson Time: 30 minutes, 5E: Explore

Materials:

- Weathering, Erosion, Deposition Sort

Lesson Guide

1. In pairs, ask students to come up with the number of times they have seen deposition this week. Students can count based on pictures from the student edition, drawings from their interactive notebooks, and even instances from investigation labs.

2. Have students read the article.

3. Have students complete the graphic organizer Weathering, Erosion, Deposition in pairs.

- Give students time to cut and sort the cards between “weathering,” “erosion,” and “deposition.”

- Use this time to address misconceptions by asking questions:

1. What action is this card doing or performing? (Answers will vary.)

2. Which action does that match with? (break, take, or drop)

4. Have students create skits to show that they know the difference between weathering, erosion, and deposition. Encourage students to include what landforms are created through each process.

Original Text: 1. Gravity and Erosion (45 minutes): Students will play a game that simulates weathering, erosion, and deposition and read an article to further understand the role of gravity in erosion.2. Plants and Erosion (30 minutes): Students will identify the effects of erosion with and without plants through measurements and observations.3. Deposition (30 minutes): Students will complete a sorting activity to identify weathering, erosion, and deposition and create skits to demonstrate the differences between each process.4. Preventing Erosion (60 minutes): Students will read an article and complete an investigative lab to determine the effects that plants have on the rate of erosion.

Updated Text: (removed Plants and Erosion extension activity description and thumbnail)

1. Gravity and Erosion (45 minutes): Students will play a game that simulates weathering, erosion, and deposition and read an article to further understand the role of gravity in erosion.
2. Deposition (30 minutes): Students will complete a sorting activity to identify weathering, erosion, and deposition and create skits to demonstrate the differences between each process.
3. Preventing Erosion (60 minutes): Students will read an article and complete an investigative lab to determine the effects that plants have on the rate of erosion.

Current Page Number(s): 1-4

Location: Printable: Studies Weekly Online, Unit 12, Activity 4, "Deposition Article" (pdf pg. 1-4)

Original Text: Weathering, erosion, and deposition slowly change the landscape. After Earth's surface is weathered and eroded, small pieces of rock are left in a new place. This is called deposition. Small pieces of rocks can be deposited a few inches, a few feet, or many miles from where they were weathered.

When water deposits small pieces of rock, it can create a buildup. Beaches are a result of water deposition. In Hawaii, eroded lava is deposited onto the beaches as black sand.

Wind can also deposit small particles of rocks. Sand dunes are examples of wind deposition. The wind deposits sand in certain areas. This buildup creates a sand dune.

Ice also deposits pieces of Earth. This happens when ice moves down a mountainside. Do you see the deposits at the base of these mountains in this image? These deposits were left by a moving glacier. If you look closer, you can even see parts of the glacier.

What is the effect of deposition?

Decide if the following statement is true or false. Provide reasoning. Deposition can only occur after weathering and erosion.

Updated Text: (Edited to include direct instruction and asking students to draw a model of slow changes to Earth's surface caused by deposition from wind and ice, see below)

Weathering, erosion, and deposition slowly change the landscape. After Earth's surface is weathered and eroded, small

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1254 of 3538

pieces of rock are left in a new place. This is called deposition. Small pieces of rocks can be deposited a few inches, a few feet, or many miles from where they were weathered.

Deposition can occur from water. When moving water slows down, or loses energy, it can deposit small pieces of rock. Deposition can cause slow changes to earth's surface over time. If water deposits small pieces of rock in the same location over and over again it can create a build up of small pieces of rock. This creates a slow change to earth's surface. Beaches are a result of a slow change to earth's surface that is caused by water depositing small rocks in the same area. In Hawaii, eroded lava is deposited onto the beaches as black sand.

Deposition can occur from wind. When wind carrying small pieces of rock slows down or runs into an obstacle, such as a landform, the tiny pieces of rock can be deposited. Deposition can cause slow changes to earth's surface over time. Sand dunes are examples of changes to earth's surface caused by wind deposition. The wind deposits sand in certain areas. This buildup creates a sand dune.

Deposition can occur from ice. When ice carrying small pieces of rock slows down or stops moving, the pieces of rock can be deposited in an area. Deposition can cause slow changes to earth's surface over time. Glaciers can cause slow changes to earth's surface as they move down a mountainside and deposit rock. Do you see the deposits at the base of these mountains in this image? These deposits were left by a moving glacier. If you look closer, you can even see parts of the glacier.

Draw a model to show how deposition by wind can cause slow changes to earth's surface.

Draw a model to show how deposition by ice can cause slow changes to earth's surface.

Current Page Number(s): n/a

Location: Podcast: Studies Weekly Online, Unit 9, "Seasons in the Sun: Topic Background Podcast," 2nd, 4th, and 5th paragraphs

Original Text: (Audio script) Students are fascinated to learn about the connections between the sun, moon, and Earth. Often, we live our lives by this important system. When the sun is in the sky, we wake up and begin our day. When the moon makes its appearance, it's time for our day to end. In this unit, students are eager to discover how this system affects seasons, temperature, and length of daylight. ... In fourth grade, students learn that Earth's change in seasons, temperature, and length of daylight happens simultaneously. Many places on Earth have four seasons: summer, fall, winter, and spring. Temperature and length of daylight change as the seasons change. In the summer, you might notice the sun is out longer. The extra daylight might allow you to enjoy more time outside. However, in the winter, the sun sets early. You might notice it's dark when you wake up and dark again long before you go to sleep. Why does this happen? Throughout the year, parts of Earth get more direct sunlight from the sun as Earth tilt. More direct sunlight increases the amount of daylight people experience. Direct sunlight also causes Earth's surface to heat up. Therefore, more direct sunlight increases the temperature. This is why summer is usually warmer and has longer daylight hours. The temperature and amount of daylight change along with the seasons. When Earth tilts the other way and that same part of Earth receives less direct sunlight, people there experience winter. Winter has cooler temperatures and a shorter amount of daylight. A common misconception students have is that seasonal change occurs at the same time for all parts of Earth. Students may assume that all of Earth experiences the same temperature and length of daylight at the same time. A large takeaway from this unit is that Earth orbits the sun and tilts on its axis, which changes which parts of Earth

receive more or less direct sunlight. One part of Earth receives more direct sunlight while, at the same time, another part of Earth receives less direct sunlight. While one part of Earth experiences summer, warmer temperatures, and longer daylight hours, the other part experiences the opposite.

Updated Text: (Updated audio script to remove information about the sun's tilt) Students are fascinated to learn about the connections between the sun, moon, and Earth. Often, we live our lives by this important system. When the sun is in the sky, we wake up and begin our day. The moon often makes its appearance at night time. In this unit, students are eager to discover how this system affects seasons, temperature, and length of daylight. ... In fourth grade, students learn that Earth's change in seasons, temperature, and length of daylight happens simultaneously. Many places on Earth have four seasons: summer, fall, winter, and spring. Temperature and length of daylight change as the seasons change. In the summer, you might notice the sun is out longer. The extra daylight might allow you to enjoy more time outside. However, in the winter, the sun sets early. You might notice it's dark when you wake up and dark again long before you go to sleep. Why does this happen? Throughout the year, parts of Earth get more direct sunlight from the sun as Earth orbits the sun. More direct sunlight increases the amount of daylight people experience. Direct sunlight also causes Earth's surface to heat up. Therefore, more direct sunlight increases the temperature. This is why summer is usually warmer and has longer daylight hours. The temperature and amount of daylight change along with the seasons. When Earth receives less direct sunlight, people there experience winter. Winter has cooler temperatures and a shorter amount of daylight. The reason for this is due to the tilt of the earth along its axis. Students in 4th grade don't need to understand this but it's helpful for you to know why. A common misconception students have is that seasonal change occurs at the same time for all parts of Earth. Students may assume that all of Earth experiences the same temperature and length of daylight at the same time. An important takeaway from this unit is that as the Earth orbits the sun it changes which parts of Earth receive more or less direct sunlight. One part of Earth receives more direct sunlight while, at the same time, another part of Earth receives less direct sunlight. While one part of Earth experiences summer, warmer temperatures, and longer daylight hours, the other part experiences the opposite.

Location: Teacher Edition, Unit 8, Activity 4, "Whole Group," Steps 7-10 (PDF pg. 18)

Original Text: 7. Ask: What evidence supports the claim that each electrical path produced light? (The light bulb turned on.)

8. Discuss: How did an open or closed path affect the light energy that was produced? (An open path did not produce light energy, while a closed path did produce light energy.)

9. Discuss: What evidence supports the claim that each electrical path produced thermal energy? (We know each electrical path produced thermal energy because we were able to record a temperature reading.)

10. Discuss: What type of path recorded higher temperatures? (closed) Why? (A closed path recorded higher temperatures because more electrical energy was able to travel through the path and produce thermal energy.)

Updated Text:

7. Discuss: How did an open or closed path affect the energy that was produced? (An open path did not produce light or thermal energy, while a closed path did produce light and thermal energy.)

8. Ask: What evidence supports the claim that a closed electrical path produced light energy? (The light bulb turned on.)

9. Discuss: What evidence supports the claim that a closed electrical path produced thermal energy? (We were able to record a higher temperature reading for the electrical path that was closed for the whole 20 minutes.)

10. Discuss: Why does a closed path record higher temperatures?

- Explain to students that a closed path recorded higher temperatures because more electrical energy produces thermal energy. By having the path closed the whole 20 minutes, more electrical energy was able to travel through the path and produce more thermal energy, raising the temperature.

Original Text: (pdf pg. 2)

Which light reached the highest temperature?

What was the highest temperature recorded?

Explain what this experiment has to do with an open and closed path.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1258 of 3538

(pdf pg. 4)

Which light reached the highest temperature? Light B

What was the highest temperature recorded? Answers may vary.

Explain what this experiment has to do with an open and closed path. Light B had a closed path and remained on for the full 20 minutes. The electrical energy was flowing freely all that time. Light A had a closed path for a minute where the electrical energy was flowing and then an open path for a minute where the electrical energy was not flowing. A closed path will produce light and heat.

Updated Text: (Added student-created model to activity)

(pdf pg. 2)

Which light reached the highest temperature?

What was the highest temperature recorded?

Draw and label a model of the light setup that produced the most thermal energy. Be sure to include an arrow to show the flow of electrical energy.

Write a brief description of your model.

Explain what this experiment has to do with an open and closed path

(pdf pg. 4)

Which light reaches the highest temperature? Light B

What was the highest temperature recorded? Answers may vary.

Draw and label a model of the light setup that produced the most thermal energy. Be sure to include an arrow to show the flow of electrical energy. Drawings should include the light source plugged into the outlet and an indication that the light is on and thermal energy is present. There should be an arrow pointing from the outlet to the lightbulb and then an arrow from the light bulb to the outlet to form a continuous loop.

Write a brief description of your model. Descriptions may vary but should include that electrical energy traveling in a closed path produces thermal energy.

Explain what this experiment has to do with an open and closed path. Light B had a closed path and remained on for the full 20 minutes. The electrical energy was flowing freely all that time. Light A had a closed path for a minute where the electrical energy was flowing and then an open path for a minute where the electrical energy was not flowing. A closed path will produce light and heat.

When we cook brownies, we want the metal racks in the oven to get hot, and then we want those hot racks to transfer their energy to the pan. When that happens, the metal or glass pan will then transfer the energy to our brownies, so they can bake

Updated Text: Glass and metal are conductors, or materials that allow heat to transfer easily. When we cook brownies, we want the air in the oven to get hot. This thermal energy will transfer to the pan and batter inside. The metal racks also help to conduct heat and transfer energy into the metal or glass pan.

Original Text: (Audio Script)

In third grade, students learned that materials can be combined. Sometimes, materials are combined because of their physical properties. Their physical properties can create a new object or modify existing objects. For example, adding clay to sand will make a stronger brick. In fourth grade, students learn that matter can be combined. Combinations of two or more substances are called mixtures or solutions. Combinations of matter can contain matter in any of its physical states.

...Weighing the matter is particularly useful when proving that matter is conserved.

...

A common misconception students have is that at least one of the substances in a mixture disappears. This is very common when dissolving solids in liquids. You can use a soil and water mixture to clarify this misconception. Observing and measuring the weight before mixing the soil with water is important because students often think the solid soil matter disappears once combined with water. When the soil and water mixture is weighed together, the weight will be the same as the two separate substances.

Updated Text: (Audio script changed to clarify that mass is measured)

In third grade, students learned that materials can be combined. Sometimes, materials are combined because of their physical properties. Their physical properties can create a new object or modify existing objects. For example, adding

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1269 of 3538

sand to clay will make a stronger brick. In fourth grade, students learn that matter can be combined. Combinations of two or more substances are called mixtures. A solution is a special kind of mixture in which the components are not easily separated such as dissolving salt in water. Combinations of matter can contain matter in any of its physical states.

... Measuring the mass of the matter is particularly useful when proving that matter is conserved.

...

A common misconception students have is that at least one of the substances in a mixture disappears. This is very common when dissolving solids in liquids. You can use a soil and water mixture to clarify this misconception. Observing and measuring the mass before mixing the soil with water is important because students often think the solid soil matter disappears once combined with water. When the soil and water mixture is measured together, the mass will be the same as the two separate substances.

Original Text: Dear families,

...

The vocabulary terms that they need to know are:

- dissolve: when a solid is to become incorporated into a liquid so as to form a solution. The solid appears to disappear.
- ingredient: one part of mixture or solution
- mixture: a substance made by mixing two or more ingredients together that can easily be separated
- physical properties: how an object looks, feels, smells, tastes, or sounds
- solution: a substance made by mixing two or more ingredients together, that cannot be easily separated (e.g., lemonade, saltwater)

Updated Text: (Updated vocabulary section to align with New Vocabulary in Standards Coverage Chart, see below)

Dear Families,

...

The new vocabulary terms that students need to know are:

- dissolve: when a solid is to become incorporated into a liquid so as to form a solution. The solid appears to disappear.
- mixture: a substance made by mixing two or more ingredients together that can easily be separated
- sieve: a tool consisting of wire and mesh held in a frame, which can be used to separate solids from liquids or bigger

Original Text:

Dear families,

...

The vocabulary terms that students need to know are: • mass: the amount of matter in an object • matter: anything that has weight and takes up space • physical properties: how an object looks, feels, smells, tastes, or sounds • temperature: the measure of how hot or cold something is • volume: the amount of space that an object/substance takes up

Updated Text: (Updated new vocabulary to align with Standards coverage chart, see below)

Dear Families,

...

The new vocabulary terms that students need to know are:

- density: the ability of matter to sink or float in water
- physical state: the form that matter can exist in

Original Text: Activity 1 Formative Assessment

Have students grade themselves using the Questioning Rubric to check for understanding and proficiency.

Activity 5, Student Edition Answers

Gather Information

Why might we classify items based on their temperatures? Answers may vary. Answers might include the idea that items are classified based on temperature when we do not want items to freeze or melt. We might also classify items based on temperature when they are a safety hazard.

What does room temperature mean? Room temperature means the temperature of the air that currently surrounds you.

Look back at your tree map. Choose one item and describe how you classified that item and why. Answers may vary.

Example: The glue had a temperature of 21 degrees Celsius. This was cooler than most items in the junk drawer, so I classified it as a cool item.

When have you seen or classified items based on their temperatures? Answers will vary. Answers may include the idea that items can be classified by their temperature in a grocery store, at home in the kitchen, in the cafeteria, when you are packing to go somewhere, etc.

Activity 6, Student Edition Answers

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1277 of 3538

Gather Information

How can we observe if items are magnetic? We can observe if items are magnetic by placing a magnet close to them and observing if they are attracted or repelled to the magnet.

Why might we need to classify items based on whether they are magnetic or not? We might need to classify items based on whether they are magnetic or not to keep them separated and easy to use.

Look back at your tree map. Choose one item and describe how you classified that item and why. Answers may vary.

Example: A quarter is not magnetic because it was not attracted or repelled by the magnet.

Based on your tree map, are all shiny silver items magnetic? How do you know? All shiny silver items are not magnetic. Quarters and aluminum foil are shiny and silver but not magnetic.

Activity 9, Student Edition Answers, Question 2

Describe how and why you classified items three items the way you did.

Activity 10, Formative Assessment

Use student participation in the section "Communicate and Present Solutions" to check for proficiency of the success criteria.

Updated Text: (Updated Activity 1 and 10 formative assessments to align with Teacher Edition text; Updated Activity 5, 6, and 9 to align with Student Edition text)

Activity 1 Formative Assessment

Page 1285 of 3538

Original Text: Activity 1: Lense of Recurring Themes and Concepts

Student Edition Answers: Vocabulary: pattern: repeated information that predicts future information

recurring themes and concepts: ideas that repeatedly occur in science and provide connections to other topics

Look at the images of the poison ivy leaves. If humans touch poison ivy, they are likely to get a red, itchy rash. Now, look at the poison ivy leaves through the lens of patterns. Discuss observations with a partner. Describe the similarities and differences you see between the images of the poison ivy leaves and other leaves you may have seen before. (Answers may vary, but some may say that poison ivy has three green leaves, with distinct ridges on their leaves. They may have seen other leaves of different shape and color than the green poison ivy leaf.)

Original Text: Activity 1

Formative Assessment: Prior to the activity, use the Ask Questions: Teacher Instruction Page to prepare for the activity. Activity 2

Formative Assessment: Use the Investigation Plan printable to check for proficiency of the success criteria.

Activity 4

Student Edition Answers

1. What observations may have led to this data being collected? Answers may vary, but could include: The teacher noticed that students in different class years showed varied interest in particular fruits at lunch.

2. What measurements were taken as evidence? (student favorite colors)

3. What significant features or patterns do you see in the data? (red, blue and purple had the most student votes)

4. According to the bar graph, how many total students chose the colors red and orange altogether? (12 students)

5. What inferences can you make based on the observations from this bar graph? (Many students like red because it is bright.)

6. How are your observations and inferences different when reviewing this data? (The data shows the exact colors that students preferred, and my inference is the reason why students liked those colors.)

Updated Text: (Aligned Activity 1 and 2 Formative Assessments to Teacher Edition. Aligned Activity 4 Student Edition Answers to the Student Edition, see below)

Activity 1

Formative Assessment: Use students' "Reflect and Connect" writing samples to check for proficiency of the success criteria.

Activity 2

Formative Assessment: Use the Investigation Plan printable to check for proficiency of the criteria.

Activity 4

Student Edition Answers

1. What measurements were taken as evidence? (student favorite colors)
2. What significant features or patterns do you see in the data? (red, blue and purple had the most student votes)
3. According to the bar graph, how many total students chose the colors red and orange altogether? (12 students)
4. What inferences can you make based on the observations from this bar graph? (Many students like red because it is bright.)
5. How are your observations and inferences different when reviewing this data? (The data shows the exact colors that students preferred, and my inference is the reason why students liked those colors.)

Original Text: 1. Discuss: Do you see any patterns? If so, what patterns do you see?

a. Have students talk with a partner. (Depending on the season and location, answers will vary but may include: fall temperatures decrease; it gets colder; etc.)

2. Say: Based on the temperature data, we can see that the overall temperatures are decreasing in the fall.

a. Draw the trend line over the whole graph in marker.

Updated Text: (Renamed section to Whole Group, added 3 more steps to clarify content)

Whole Group1. Discuss: Do you see any patterns? If so, what patterns do you see?a. Have students talk with a partner. (Depending on the season and location, answers will vary but may include: fall temperatures decrease; it gets colder; etc.)2. Say: Based on the temperature data, we can see that the overall temperatures are decreasing in the fall.a. Draw the trend line over the whole graph in marker.3. Discuss: Based on the data you collected, what do you predict will happen to the temperature in the next season?- Explain to students that based on data collected, they can predict the pattern of the change in seasons. For example, the temperature will decrease even more in the winter.4. Say: From analyzing the data, I see the trend line is decreasing during fall, so we can predict that the temperature decrease will continue into the next season.5. Ask: Do you think the temperature will keep decreasing every season? (No; the temperature will increase because it gets warmer in the spring and summer.)

Location: Teacher Edition, Unit 11, Activity 5, "Reading to Learn," Steps 1-2 (PDF pg. 27)

Original Text: 1. Have students follow the directions in their student editions.- This is an opportunity for students to internalize new academic language by using and reusing it in meaningful ways in writing activities that build concept and language attainment. [ELPS 1E]2. Call on students to share their illustrations and descriptions of how evaporation, condensation, precipitation, and collection were involved in the experiment

Updated Text: (inserted new steps 1-2, moved the original steps down)

1. Have students observe the illustration before reading the article.
2. Ask: What do the arrows on the illustration represent? (The arrows illustrate the continuous movement of water on the surface of the Earth.)
3. Have students follow the directions in their student editions.
- This is an opportunity for students to internalize new academic language by using and reusing it in meaningful ways in writing activities that build concept and language attainment. [ELPS 1E]
4. Call on students to share their illustrations and descriptions of how evaporation, condensation, precipitation, and collection were involved in the experiment

Original Text:

2. Discuss: How do factors such as recycling and disposal cause changes in our environment? (If we recycle objects or properly dispose of objects so that they can be reused, then fewer resources are being used to create a new one. Fewer resources being used means less pollution in our environment.)

Updated Text: (replaced step 2 with 3 new discussion questions)

2. Discuss: How does throwing an object away affect the environment?
a. Explain to students that when an object is thrown away, the natural resources and energy used to create that object are wasted. It takes energy to transport the object to a landfill, where it takes up space as it rots.
3. Discuss: Which disposal methods have the smallest effect on the environment? How do you know?
a. Explain to students that recycling and reusing objects has the smallest effect on the environment. It takes less energy and no new natural resources to turn an already-made object into a new one. Using energy and natural resources can cause pollution, so using less means less pollution.
4. Discuss: How would buying fewer new objects affect the environment?
a. Explain to students that buying fewer new objects would conserve natural resources and energy, which means less pollution.

Original Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

The student understands how natural resources are important and can be managed.

Updated Text: 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

Recurring themes and concepts. The student understands that recurring themes and concepts provide a framework for making connections across disciplines.

Note: Content for TEKS 1 to 5 appears within all other Units. Examples are provided in the Texas Essential Knowledge and Skills section and detailed in correlations.

Updated Text: Idea Boxes

Idea boxes placed throughout the chapter text function to provide opportunities for collaborative discussion of content, review of content introduced, and focus on certain content that is harder to grasp. Guidance on how to use the idea boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by:

- Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support).
- Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box.
- Planning to have at hand any materials needed to implement the Idea box.
- Reviewing the task information contained within the Idea boxes.

Original Text: **Transportation**

Humans need to find solutions for changing how we get around. Our current transportation modes account for one-half of all air pollution, one-third of greenhouse gas emissions, one-quarter of air contamination, and one-fifth of water toxicity. Reducing our use of these current transportation modes and planning to use alternative modes will reduce the amount of pollution in the air. It will also help conserve nonrenewable resources like oil used to power cars and other vehicles.

Energy usage

Humans can select more renewable energy sources (wind, solar, hydroelectric, and geothermal) to conserve our nonrenewable resources. We can also reduce our energy use and use energy-efficient appliances and materials.

Food

Humans can make an effort to choose in-season, locally grown foods. This conserves the oil and gas that is resources needed to transport produce grown in different regions of the world. far away and cuts down on the pollution caused by transporting those goods.

Updated Text: Updated section titled "Alignment with Science TEKS. These changes are:

1. Separate single list into 3 separate tables. First table is for science and engineering practice TEKS. Second table is for recurring theme TEKS. Third table is for content TEKS.
2. Inclusion of an explanation of each student expectation in the column titled "Explanation of the TEKS." Click the URL for Updated Text (make sure to sign into ADI Review Site First: Password is ADITEARev2024!). Download PDF file under heading "Investigation Standards PDF." Open the file. New content is under the heading "Alignment with Science TEKS."
3. Added a column titled "Focus" indicating if this is the first time students are learning the student expectation or if it is a re-introduction of the student expectation.
4. Added 2 columns on vertical alignment. One column is for grade 4 TEKS and one column is for middle school TEKS.

Original Text: List of student expectations

Updated Text: Updated section titled "Alignment with Science TEKS. These changes are:

1. Separate single list into 3 separate tables. First table is for science and engineering practice TEKS. Second table is for recurring theme TEKS. Third table is for content TEKS.
2. Inclusion of an explanation of each student expectation in the column titled "Explanation of the TEKS." Click the URL for Updated Text (make sure to sign into ADI Review Site First: Password is ADITEARev2024!). Download PDF file under heading "Investigation Standards PDF." Open the file. New content is under the heading "Alignment with Science TEKS."
3. Added a column titled "Focus" indicating if this is the first time students are learning the student expectation or if it is a re-introduction of the student expectation.
4. Added 2 columns on vertical alignment. One column is for grade 4 TEKS and one column is for middle school TEKS.

Original Text: Follow all class safety rules as you do this activity. In addition, be sure to:

- Wear sanitized safety goggles during setup, while collecting data, and when you clean up.
- Be careful when handling bulbs, batteries, and wires—they can get hot and burn your skin. Also, bulbs are made of glass and can cut you if they break, and wire ends are sharp and can cut or puncture your skin.
- Never put bulbs, batteries, or wires in your mouth or on your tongue.
- Wash your hands with soap and water when you are done cleaning up.

Updated Text: Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Handle glass with care. Always wear gloves and safety goggles when handling glass materials.
- Always wear rubber gloves when handling wires/batteries
- Be careful when handling bulbs, batteries, and wires—they can get hot and burn your skin. Also, bulbs are made of glass and can cut you if they break, and wire ends are sharp and can cut or puncture your skin.
- Never put bulbs, batteries, or wires in your mouth or on your tongue.
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Let your teacher know if any materials got broken during your investigation. Do not touch broken glass.
- Return your safety goggles to the place where they are stored in your classroom.

Original Text: Safety Note

Follow all class safety rules as you carry out your plan. In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Do not touch the metal ends of the wire when the wires are connected to the battery.
- Handle the bulb carefully to avoid breaking it. If the bulb does break, do not touch any glass. Let your teacher know so they can clean up the broken glass.
- The objects may become hot when connected to the battery. Be careful when touching the objects. If they become too hot, disconnect the battery.
- Wash your hands with soap and water when you are done cleaning up.

These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Handle liquids with care. Always wear gloves, a lab coat/apron, and safety goggles when handling liquids.
- Keep your eyes safe! Always wear safety goggles when sand/powder is present in the work area.
- Fallen Beads/BBs/Marbles/Shot may present a trip/slip hazard. Be careful to keep your materials in your work area and be careful walking around your classroom when these materials are present.
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Return your supplies to the supply area.
- Return your safety goggles to the place where they are stored in your classroom.

- Wear sanitized safety goggles during setup, while collecting data, and when you clean up.
- Wash your hands with soap and water when you are done cleaning up.

Updated Text: Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Handle glass with care. Always wear gloves, a lab coat/apron, and safety goggles when handling glass materials.
- Handle lightbulb with caution, as it may get hot during use and may cause burns if handled improperly.

While cleaning up your materials, be sure to:

- Allow lightbulb time to cool before disconnecting.
- Never touch broken glass. If any glass is broken, tell your teacher and let them help you with it.

Original Text: Follow all class safety rules as you carry out your plan. In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Protect the lens in the hand lens from scratches.
- Handle the rock samples carefully.
- Wash your hands with soap and water when you are finished cleaning up.

Updated Text: Follow all class safety rules as you carry out your plan. Make sure to look around the room for symbols that indicate how to safely carry out an investigation in science. These symbols might indicate where to dispose of liquid or solid waste. They can also indicate where safety equipment, like goggles, is kept.

In addition, be sure to:

- Wear sanitized safety goggles during setup, data collection, and cleanup.
- Always wear safety goggles, a lab coat/apron, and non-latex gloves when handling glass.
- Be careful when handling the hand lens to avoid scratching it
- Handle rocks with care
- Wash your hands with soap and water when you are done cleaning up.

While cleaning up your materials, be sure to:

- Double-check the area around your workspace and make sure to pick up any materials that fell during your investigation.

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Original Text: Progress check

Updated Text: Updated the third activity of the reflect stage in the following ways:

1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:

3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:

The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Updated Text: Updated the first paragraph of the In-Person Lesson Plan. This paragraph now reads:
The Reflect stage includes three activities: (1) discussing some core ideas used during the investigation, (2) discussing how to plan and carry out investigations, and (3) making connections to other topics in science and in other content areas as well as a progress check. The intent of this stage is to allow students to discuss the core ideas they used during this investigation, how they used the practices of science to figure out a phenomenon, and how these ideas and practices might be useful in the future.

Original Text: Original Activity provided students with the opportunity to:

1. Identify strengths in how they carried out their investigation
2. Agree on class norms for future investigation

Updated Text: Made the following revisions to this activity:

1. Adjusted the directions for students discussion on what things they did that made them good scientists during the investigation
2. Updated In-Person Lesson Plan to reflect changes in the student activity
3. Updated Teaching Tip for In Person Lessons to provide guidance for teachers on the updated student activity
4. Added opportunity to reflect on how this investigation was an improvement over prior investigations
5. Added opportunity for students to agree on additional class norms for future investigations.

Original Text: Progress check

Updated Text: Updated the third activity of the reflect stage in the following ways:

1. Changed title to "Making Connections"
2. Provide opportunity for student to make connections to other topics they learned in science this year or in prior years.
3. Provide opportunity for students to make connections between science topics using the recurring themes in science TEKS.
4. Provide an opportunity for students to make connections between what they learned in this investigation and what they learned in other subjects, such as math.
5. Changed the text of the exit ticket to ask students how they used the practices, recurring themes, and ideas to answer the guiding question
6. Updated In-Person Lesson plan
7. Updated the Teaching Tip for In-Person Lessons

Original Text: We often need to track how energy flows into, out of, or within a system. When energy transfers into an object through light, the object will increase in temperature. Because of this, you can track how much energy transfers into an object from light by measuring how much the temperature of that object changes. The more energy that transfers into an object from the light, the more the temperature of that object will increase over time.

Updated Text: Scientists often investigate how energy flows into, out of, or within a system. When energy transfers into an object through light, the object will increase in temperature. Because of this, scientists can track how much energy transfers into an object from light by measuring how much the temperature of that object changes. The more energy that transfers into an object from the light, the more the temperature of that object will increase over time.

In this investigation, you will also need to track how energy flows between two objects in the system. Light energy will be transferred from the lightbulb in the lamp to the container. You will be able to use containers that are each a different color to help understand how changing color can help an anole regulate its body temperature.

Original Text: Many organisms are responsive to the environment they live in. When the environment changes, this can cause a change in the organisms living in that environment.

One of the biggest factors impacting change in organisms is the change in the seasons each year. When the season change, many organisms will also undergo noticeable changes. This is because the length of daylight also changes during the seasons. The day is longest during the summer and shortest during the winter. When there are longer days in the summer, the leaves of trees are green. As the day gets shorter, the leaves change color. Finally, when the day is shortest in the winter, many trees lose their leaves completely. The image below shows a cherry blossom tree throughout the year. The changes in the tree are due to the changes in the environment.

Updated Text: Biologists are scientists who study living things, such as plants and animals. One thing biologists do is to explain how different factors or environmental conditions impact organisms. For example, many biologists study if an animal's diet impacts its health. The factor the biologist is explaining is diet, or what the animal eats. This allows the biologist to explain how and why giving chocolate to a dog, for example, will negatively impact the dog even though humans can safely eat chocolate.

Biologists also study how environmental conditions impacts organisms and explain what happens to organisms when the environment they live in changes. Biologists also want to explain why that change happens. Many plants and animals are responsive to the environment they live in. When the environment changes, this can cause a change in the plants and

Original Text: The ADI instructional model (Sampson et al., 2009, 2011, 2014, 2015; Sampson & Gleim, 2009; Sampson & Walker, 2012; Walker et al., 2011) was created using the most up-to-date findings on learning and then tested and refined through university-based research in partnership with school districts throughout Texas. As part of this development process, the instructional model was the focus of numerous studies (see Research on ADI) that took place in actual classrooms over a period of ten years. This instructional model is intended to serve as a guide or a template for creating meaningful, rigorous, and equitable 3D science investigations (such as the ones included in these instructional materials). When teachers use these investigations inside their classrooms, their students not only have an opportunity to learn new SCIs, RTCs, and SEPs that are found in the revised TEKS as they figure out how or why something happens, but they are also encouraged to use SCIs, RTCs, and SEPs that they learned during prior investigations (or grades) as part of the process. Each investigation also has the following features:

Updated Text: The ADI instructional model (Sampson et al., 2009, 2011, 2014, 2015; Sampson & Gleim, 2009; Sampson & Walker, 2012; Walker et al., 2011) was first created using the most up-to-date findings about how people learn and then tested and refined over time through university-based research in partnership with school districts throughout Texas. As part of this development process, the instructional model was the focus of numerous studies (see Research on ADI) that

took place in actual classrooms over a period of ten years. This instructional model is intended to serve as a guide or a template for creating meaningful, rigorous, and equitable 3D science investigations or design challenges. When teachers use these investigations inside their classrooms, their students not only have an opportunity to learn new DC, RTCs, and SEPs that are found in the revised TEKS as they figure out how or why something happens, but they are also encouraged to use DC, RTCs, and SEPs that they learned during prior investigations (or grades) as part of the process. Each investigation also has the following features:

Original Text: This instructional model includes seven stages of classroom activity (see image below). These seven stages of the instructional model provide a structure that supports students as they investigate a phenomenon, make sense of that phenomenon, and evaluate and refine ideas, explanations, or arguments (NRC, 2012). ADI also provides an authentic context for students to develop fundamental literacy skills and to learn or apply mathematical concepts and practices. Finally, and perhaps most importantly, these investigations create a language rich learning environment that enables emerging multilingual students to acquire a new language as they learn science.

Updated Text: This instructional model includes seven stages of classroom activity (see image below). These seven stages of the instructional model provide a structure that supports students as they make sense of a phenomenon or problem, create an explanation or solution, share arguments to support the validity or acceptability of these explanations or solutions, and then refine these explanations, solutions, and arguments based on feedback (NRC, 2012). ADI also provides an authentic context for students to develop fundamental literacy skills and to learn or apply mathematical concepts and practices. Finally, and perhaps most importantly, these investigations and design challenges create a language rich learning environment that enables emerging multilingual students to acquire a new language as they learn science.

Original Text: The first activity of this stage of an investigation begins with the introduction of a phenomenon to create a need for students to figure something out. A phenomenon is simply an observable event. The phenomenon will usually be in video format. Students should be encouraged to record what they noticed and wonder about the phenomenon as they watch the video introduction in the task stage handout (see image at right). The students should then be given an opportunity to share their observations and questions with the rest of the class. At this point, students are interested and want to know more about the phenomenon.

Updated Text: The first activity of this stage of an investigation begins with the introduction of a phenomenon or a problem to solve. This introduction of a phenomenon or problem at the beginning of the investigation or design challenge creates a need for students to figure something out. The phenomenon or problem to solve will usually be presented to student in video format. Students should be encouraged to record what they noticed and wonder about the phenomenon or problem as they watch the video introduction in the task stage handout (see image at right). The students should then be given an opportunity to share their observations and questions with the rest of the class. At this point, students are interested and want to know more about the phenomenon or problem.

We recommend students be given opportunities to share with the full class the things they wonder about in response to the phenomenon. These wonderings can be written on a sheet of chart paper or on the whiteboard and displayed as a Wonder Wall—a specific place to document the scientifically oriented questions students pose in response to the phenomenon. A Wonder Wall ensures that all students questions about the phenomenon are acknowledged as valid and their contributions to class discourse are valued. The Wonder Wall also provides resources for extension activities for students in the Do and Share stage.

Original Text: The students are given an opportunity to share what they already know about the phenomenon during the third activity of this stage. Students begin by drawing a picture that shows what they know about the phenomenon (or in some cases a related phenomenon that is more familiar to them). They should also be encouraged to use words to help explain their ideas or thinking as part of the picture. This activity is important because students' prior knowledge and experiences related to the phenomenon can be used as a starting point for student sense-making. Teachers can then leverage the prior knowledge and experiences of the students in their classes as a tool to help students figure out how or why something happens in the world around them. This stage also provides multiple opportunities to practice, develop, and demonstrate mastery of the following grade-level SEPs as outlined in the TEKS:

Updated Text: The students are then given an opportunity to share what they already know about the phenomenon or the problem during the third activity of this stage. Students begin by drawing a picture to illustrate what they know about the phenomenon or the problem on the task stage handout (see image at right). They should also be encouraged to use words to help explain their ideas or thinking as part of the picture.

Once all the students have drawn and labeled a picture (which is a basic conceptual model of their thinking), they should be given time to share their ideas with the other students in their group. As they share their ideas, they will start asking more questions about the phenomenon and begin to think about what else they will need to know before they will be able to answer the guiding question. Finally, each group of students should be encouraged to generate a list of at least three things that they will need to learn more about during the investigation.

Original Text: The second activity of the report stage gives students an opportunity to review the reports in pairs using the peer-review guide and teacher scoring rubric (PRG/TSR; see images below). The PRG/TSR contains specific criteria that are to be used by a pair of students as they evaluate the quality of each section of the investigation report as well as the quality of the writing. There is also space for the reviewers to provide the author with feedback about how to improve the report. Once a pair of students finishes reviewing a report as a team, they are given another report to review. When students are grouped together in pairs, they only need to review two different reports. Be sure to give students only 15 minutes to review each report (we recommend setting a timer to help manage time). When students are grouped into pairs and given 15 minutes to complete each review, the entire peer-review process can be completed in 30 minutes (2 different reports × 15 minutes = 30 minutes).

Updated Text: The second activity of the report stage gives students an opportunity to review the reports in pairs using the peer-review guide and teacher scoring rubric (PRG/TSR; see images below). The PRG/TSR is designed as an analytical

Proclamation 2024: Report of Editorial Changes (11/08/2023)

rubric that makes the criteria for mastery of the task explicit. It contains four sections. One section focuses on the introduction of the report, one section focuses on the method, one on the argument, and one on the overall writing mechanics. Each section contains specific criteria that are unique to each section of the report. These criteria are framed as questions that can be answer with an answer of “yes” (meets expectations for that criterion), “somewhat” (approaches expectations for the criterion), or “no” (does not meet expectations for that criterion). The pair of students can simply answer each question as they evaluate the quality of each section of the report as well as the quality of the writing. There is also space for the reviewers to provide the author with feedback about how to improve the report. Educational research suggests analytical rubrics are particularly effective for promoting growth throughout the year, as the norms for what counts as quality consistently evolve with students increased knowledge and skill. This type of rubric stands in contrast to a rubric normed against a static standard of performance. A rubric with a specific standard as the end goal cannot provide continued opportunities for growth once students meet the standard used to develop the rubric. Research also shows that analytic rubrics are effective for focusing students attention on important questions, such as the quality of evidence, along side details such as font size, neatness, or word count. While these details are important, they tend to be the sole focus of rubrics normed against a static standard of performance.

Once a pair of students finishes reviewing a report as a team, they are given another report to review. When students are grouped together in pairs, they only need to review two different reports. Be sure to give students only 15 minutes to review each report (we recommend setting a timer to help manage time). When students are grouped into pairs and given 15 minutes to complete each review, the entire peer-review process can be completed in 30 minutes (2 different reports × 15 minutes = 30 minutes).

Link to Updated Content:
[View Updated Content](#)

Original Text: The final activity of the report stage is to revise the report. Each student is required to rewrite their report using the reviewers' comments and suggestions as a guideline. The author is also required to explain what they did to improve each section of the report in response to the reviewers' suggestions in the author response section of the PRG/TSR. Once the report is revised, it is turned in to the teacher for evaluation. The teacher can then provide a score on the PRG/TSR in the column labeled “Teacher Score” and use these ratings to assign an overall grade for the report. This approach provides all students with a chance to improve their writing mechanics and develop their reasoning and understanding of the content. This process also offers students the added benefit of reducing academic pressure by providing support in obtaining the highest possible grade for their final product.

Updated Text: The final activity of the report stage is to revise the report. Each student is required to rewrite their report using the reviewers' comments and suggestions as a guideline. The author is also required to explain what they did to improve each section of the report in response to the reviewers' suggestions in the author response section of the PRG/TSR. This approach provides all students with a chance to improve their writing mechanics and develop their reasoning and understanding of the content. This process also offers students the added benefit of reducing academic pressure by providing support in obtaining the highest possible grade for their final product. Once the report is revised, it is turned in to the teacher for evaluation. The teacher can then provide a score on the PRG/TSR in the column labeled “Teacher Score” and use these ratings to assign an overall grade for the report.

The PRG/TSR, as noted earlier, is designed to be an analytical rubric rather than a holistic one. Analytical rubrics break down the characteristics of an assignment or products into parts, allowing the scorer to itemize and define exactly what aspects are strong, and which ones need improvement (Dlugokienski & Sampson, 2008). Holistic rubrics, in contrast, often list three to five levels of performance, along with a broad description of the characteristics that define each level. The main advantage of an analytical rubric is that it provides targeted feedback to students. We take this one step further and identify the criteria that, when used together, indicates that a student can write a report to share what was figured out during an investigation using DC, RTCs, and SEPs. Thus, a score of two on each criterion (meets expectations) indicates that a student has reached a level of mastery. Each criterion is also phrased as question, rather than a description, to help facilitate scoring and reduce bias. For example, two questions that included in the PRG/TSR are, “do you think the task and the guiding question or clear?” and “Do you think the analysis of the data is correct?” Answering “yes” to one of the these questions indicates that the student meets expectations for that criterion and should be awarded a score of two. Answering “somewhat” or “partially” indicates that a student is approaching expectations for that criterion and should be awarded a score of one. Finally, answering “no” indicates that the student needs improvement or did not include that aspect of the report and should earn a score of zero. Research on this approach not only shows that both students and teachers can review/score a report accurately using the PRG/TSR, but also student’s writing improves substantially over time because of what they learn from reviewing other reports and from the targeted feedback they receive on their own report from their peers and their teacher (Sampson et al., 2013; Sampson & Walker, 2012).

Original Text: The image below shows the report grading tool that is embedded into the ADI Learning Hub. To use this tool, teachers can require students to submit the final draft of their investigation report through the ADI Learning Hub. The teacher can read the reports and evaluate each section using the rubric. The teacher can also provide additional feedback to a student if needed. Once the report is graded, students can see their score and any feedback in the investigation dashboard of the ADI Learning Hub.

Updated Text: The image below shows the report grading tool that is embedded into the ADI Learning Hub. The report grading tool is the same analytical rubric that is included in the PRQ/TSR described earlier in the implementation guide. Analytical rubrics break down the characteristics of an assignment or products into parts, allowing the scorer to itemize and define exactly what aspects are strong, and which ones need improvement (Dlugokienski & Sampson, 2008). The report grading tool included specific criteria that, when used together, indicates that a student can write a report to share what was figured out during an investigation. Thus, a score of two on each criterion (meets expectations) indicates that a student has reached a level of mastery. Each criterion is also phrased as question, rather than a description, to help facilitate scoring and to reduce bias. For example, two of the questions found in the report grading tool include “do you think the task and the guiding question or clear?” or “Do you think the analysis of the data is correct?” Answering “yes” indicates that the student meets expectations for that criterion and should be given a score of 2, answering “somewhat” or “partially” indicates that a student is approaching expectations and should be given a score of 1 for that criterion. Answering “no” indicates that the student needs improvement or the student did not complete that aspect of the report and should be given a score of 0. Teachers can also recognize students who exceeded grade level expectations and award a score of 3 on a specific criterion. To use this tool, teachers can require students to submit the final draft of their investigation report through the ADI Learning Hub. The teacher can read the reports and evaluate each section using the analytical rubric. The teacher can also provide additional feedback to a student if needed. Once the report is graded, students can see their score and any feedback in the investigation dashboard of the ADI Learning Hub.

Location: Setting the Purpose, first paragraph.

Original Text: Engage students in the lesson by having them share their opinions about the weather. Use the SOS Strategy: Four Corners to encourage students to make connections between the weather and the water cycle. Read the following statements to the students for them to share their opinions.

Updated Text: Engage students in the lesson by having them share their opinions about the weather. You may choose to work together to make a class bar graph using sticky notes or complete the SOS strategy Four Corners as described.

Use the SOS Strategy: Four Corners to encourage students to make connections between the weather and the water cycle. Read the following statements to the students for them to share their opinions.

Component: *Science Techbook for Texas by Discovery Education: Grade 5 Unit 3 Teacher Edition*

ISBN: 9781616292294

Current Page Number(s): 56

Location: Making Predictions > ASK (second bullet)

Original Text: How does using a model help us explain how the temperature affects the water cycle? Student responses will vary. Sample response: Models help us see things that we otherwise could not see because they are too large or too small. The water cycle is too big to see, so this helps us understand it.

Updated Text: What are the advantages and limitations of using a model to help us explain how the temperature affects the water cycle? Sample response: Models help us see things that we otherwise could not see because they are too large or too small. The water cycle is too big to see, so this helps us understand it. The model we are using is not going to tell us how pollution might be affecting the water cycle.

Component: *Science Techbook for Texas by Discovery Education: Grade 5 Unit 3 Teacher Edition*

ISBN: 9781616292294

Current Page Number(s): 63

Location: English Language Proficiency Support

Original Text: Beginning: Write the phrase water cycle on the board. Prompt students to reflect back on the interactive from the previous lesson and create a simplified one together using pictures and the words sun, oceans, water vapor, clouds, and liquid.

Intermediate: Have students discuss with a partner the stages of the water cycle. Have students use these sentence frames to help their discussion. ____ heats water to form water vapor. The water will rise into the sky until it cools and forms ____ . Water will fall as ____ . Then, the process will ____ .

Advanced: Have students take turns describing what can happen to the water after it falls from the clouds using sentence starters. Water can freeze in the form of ____ . Water in the air can ____ . Water can fall into a river and ____ .

Advanced High: Have students discuss with a partner the unique paths water can take during the water cycle. Then, have volunteers share out to the group.

Updated Text: Beginning: Write the phrase water cycle on the board. Prompt students to reflect back on the interactive from the previous lesson and create a simplified one together using pictures and the words sun, oceans, water vapor, clouds, and liquid. Consider allowing students to use a signal such as a hand gesture when they do not understand spoken language during classroom instruction or interactions.

Intermediate: Have students discuss with a partner the stages of the water cycle. Have students use these sentence frames to help their discussion. ____ heats water to form water vapor. The water will rise into the sky until it cools and forms ____ . Water will fall as ____ . Then, the process will ____ . Consider allowing students to use a signal such as a hand gesture when they do not understand spoken language during classroom instruction or interactions.

Advanced: Have students take turns describing what can happen to the water after it falls from the clouds using sentence starters. Water can freeze in the form of ____ . Water in the air can ____ . Water can fall into a river and ____ . Consider allowing students to use a signal such as a hand gesture when they do not understand spoken language during classroom instruction or interactions.

Advanced High: Have students discuss with a partner the unique paths water can take during the water cycle. Then, have volunteers share out to the group. Consider allowing students to use a signal such as a hand gesture when they do not understand spoken language during classroom instruction or interactions.

Current Page Number(s): 68

Location: English Language Proficiency Support, Intermediate, Advanced, and Advanced High rows

Original Text: Intermediate: Model using the cause-and-effect graphic organizer by supplying the effect evaporation and the cause of the sun heating the water. Record students' answers as they orally supply the causes for condensation, precipitation, and weather.

Advanced: Have students work with a partner to identify the cause-and-effect relationships and complete their graphic organizer. Have students use the sentence starter: ____ causes ____ to happen. Use words from the text.

Advanced High: Have students work with a partner to orally summarize the water cycle. Encourage students to use the newly learned words evaporation, precipitation and condensation in their summary.

Updated Text: Intermediate: Model using the cause-and-effect graphic organizer by supplying the effect evaporation and the cause of the sun heating the water. Record students' answers as they orally supply the causes for condensation, precipitation, and weather. Remind students to seek clarification when they do not understand spoken language. You may need to review appropriate ways to ask for clarification.

Advanced: Have students work with a partner to identify the cause-and-effect relationships and complete their graphic organizer. Have students use the sentence starter: ____ causes ____ to happen. Use words from the text. Remind students to seek clarification when they do not understand spoken language. You may need to review appropriate ways to ask for clarification.

Advanced High: Have students work with a partner to orally summarize the water cycle. Encourage students to use the newly learned words evaporation, precipitation and condensation in their summary. Remind students to seek clarification when they do not understand spoken language. You may need to review appropriate ways to ask for clarification.

Location: Unit 2 > Concept 1 > Lesson 3 > Educator Notes > Slide 10 > Turn and Talk

Original Text: • What combination of forces is so closely balanced that the trucks hardly move? Why? Sample response: Lioness versus The Judge and Thor. Lioness pulled with the strongest force of all three trucks, and The Judge and Thor's combined force was only slightly stronger than Lioness's pulling force.

• What would happen if a new truck, with a pulling force equal to Lioness, competed against Lioness? Why? Student response: Neither truck would move because they would be exerting equal force in opposite directions.

Updated Text: • What combination of forces is so closely balanced that the trucks hardly move? Why? Sample response: Crown Joule versus Force of Nature and Velocity Raptor. Crown Joule pulled with the strongest force of all three trucks, and Force of Nature and Velocity Raptor's combined force was only slightly stronger than Crown Joule's pulling force.

• What would happen if a new truck, with a pulling force equal to Crown Joule, competed against Crown Joule? Why? Sample response: Neither truck would move because they would be exerting equal force in opposite directions.

Original Text: After students have collected their data, direct them to clean up their materials.

Allow students time to share their data and observations. Students may not all get the same results. Discuss possible differences in their result and reasons why these differences may have occurred.

Updated Text: After students have collected their data, have them display their drawing, catapult, and data around the classroom to create a gallery. Students will take turns walking around the classroom to view other groups' solutions and data. One to two students from each group should be the group representatives tasked with describing their designs and data to the students on the gallery tour. Then have group members switch positions. Encourage students to ask other groups questions about their designs and data. During the gallery tour, students should identify any differences between their designs and their peers' designs and consider how they could improve their solutions.

Location: Setting the Purpose

Original Text: Point out that most of Earth's surface is covered in ocean water, and most of the water on Earth is in the oceans. Fill the glass jar about a third full of warm water, and then cover the top with plastic wrap. (Secure the plastic wrap in place with a rubber band.) Explain that the warm water represents ocean water. The plastic wrap represents the atmosphere. Put the glass in the sunlight. Condensation should appear on the inside of the glass or on the underside of the plastic wrap.

Provide students with the opportunity to discuss their observations and ideas about what is happening in the jar. Encourage students to think by asking them to describe what they see and explain what they think causes the condensation inside of the glass. Then, ask: If the water in this model represents the ocean, what heats the atmosphere and the water? Explain that this system of a glass, cover, and some water makes a simple model of the water cycle because it shows the interaction of the sun and the ocean.

Updated Text: Point out that most of Earth's surface is covered in ocean water, and most of the water on Earth is in the oceans. Fill the plastic cup about a third full of warm water, and then cover the top with plastic wrap. (Secure the plastic wrap in place with a rubber band.) Explain that the warm water represents ocean water. The plastic wrap represents the atmosphere. Put the cup in the sunlight. Condensation should appear on the inside of the cup or on the underside of the plastic wrap.

Provide students with the opportunity to discuss their observations and ideas about what is happening in the cup. Encourage students to think by asking them to describe what they see and explain what they think causes the condensation inside of the cup. Then, ask: If the water in this model represents the ocean, what heats the atmosphere and the water? Explain that this system of a cup, cover, and some water makes a simple model of the water cycle because it shows the interaction of the sun and the ocean.

Original Text: Explain that the purpose of this interactive is to learn how food webs are used to model ecosystem changes. Students will read the questions before starting the exploration. They will follow the instructions to perform the exploration. They will then record their findings as they work through the exploration. Make sure students write the words increase or decrease when describing how the change affects the population.

It may be helpful to demonstrate the exploration by first having the students read the introduction and then click the button to continue. You can show how to drag the animals into the food web, but make sure to avoid placing an animal into the correct box. Remind students to click the “Next” button to move ahead in the exploration. They can use the reset button

to restart the screen.

Updated Text: Explain that that the purpose of this interactive is to learn how food webs are used to model ecosystem changes. Students will read the questions before starting the exploration. They will follow the instructions to perform Part 1 (Add Organisms) and Part 2 (Remove Organisms) of the exploration. They will then record their findings for Part 2 (Remove Organisms) in the data table. Make sure students write the words increase or decrease when describing how the removal of an organism affects the population.

It may be helpful to demonstrate the exploration by first having the students read the introduction and then click the button to continue. You can show how to select an organism, click the play button, watch the animation, and analyze the visual.

Explain to students that the investigation will involve recording data using a table. We can record data collected over time in tables or in line graphs. We cannot use bar graphs to represent data over time. Bar graphs are used to represent data in categories.

Location: Top of page

Original Text: N/A

Updated Text: "Many observable or testable physical properties can be used to compare and contrast matter besides those explored in the investigations.

For example, some matter is solid, such as rocks. Solids have a fixed volume and do not take the shape of their container. Liquids like water also have a fixed volume, but they will take the shape of a container. For example, milk poured out of a carton into a glass changes its shape. Gases like air do not have a fixed volume. They will spread out to fill whatever container they are in.

Another property that can be used to compare and contrast matter is magnetism. A magnet will pull metal paper clips towards itself. Most nonmetals, such as plastic and wood, will not be attracted by a magnet."

Updated Text: "Support for Student Answers

First, model of a complete circuit with a light bulb, including all parts of the system. Then, draw a second model, but leave a break in the electrical circuit. Label your models to show how the interdependent parts function in the system, focusing on what happens to the light bulb in each circuit.

Student's first model should show a complete loop that includes an energy source and a light bulb. Their second model should include similar parts, but with a break in the circuit. Labels should show that the path is needed to make a complete circuit. Students should identify the energy source, and that the light bulb transforms electrical energy into heat and light."

Original Text: "Step 1 Use proportions to set up your model. Partially fill up your roasting pan so that it is about two-thirds full of sand. Leave the bottom one-third of your pan empty.

Step 2 Use your finger to draw a "river" into your sand. Then, use your books to elevate the sandy side of your roasting pan.

Step 3 Use the sequence map later in this activity to show what your roasting pan currently looks like.

Step 4 Put on your goggles. Slowly pour two cups of water near the top of the pan into your river. Watch what happens along the river and at the base of the pan."

Updated Text: "Step 1

Use proportions to set up your model river. Cover the inside of the paper towel roll with aluminum foil. Partially fill up your paper towel roll so that it is about two-thirds full of sand. Make sure the sand is about 5–7 cm deep. Pat down the sand so it does not move.

Step 2

Then, use your books to elevate one side of the paper towel roll. Pour water in the bottom of your roasting pan to form an "ocean". Place the paper towel roll so the lower end rests in the pan and the river drains into the ocean.

Step 3

Use the sequence map later in this activity to show what your model currently looks like.

Step 4

Put on your goggles. Slowly pour two cups of water a little bit at a time near the top of the paper towel roll into your river. Watch what happens along the river and at the base of the pan in the ocean."

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1511 of 3538

Original Text: Preview the Topic

In this topic, students learn about matter. First, in Experience 1, students measure and observe physical properties of matter and compare and contrast matter based on its physical properties. Then, in Experience 2, students compare and contrast matter according to its physical state and illustrate how matter is made up of small particles. Finally, in Experience 3, students compare the properties of substances before and after they are combined into mixtures and solutions and demonstrate the conservation of matter.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of the mixing of colored water and cornstarch. As students progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question, How is this mixture different from its parts?

Topic Readiness Test

Students answer questions to show what they already know about matter by completing a printed or online Topic Readiness Test.

Teacher Background

Watch the Teacher Background Video Matter to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- A conductor is a material through which electrical energy can move easily.
- An insulator is a material through which electrical energy cannot move easily.
- Particles are the tiny parts that make up matter and are invisible to the naked eye.
- Matter can change form through physical or chemical changes, but it cannot be created or destroyed.

Original Text: Home Connection

Identify Properties of Matter Have students make a T-chart in their Science Notebooks about properties of matter. As students learn about matter throughout the topic, encourage them to work with others at home to identify as many examples of matter as they can and to measure, test, and describe the physical properties of the objects, mixtures, and solutions. Provide students with opportunities to share their observations with the class.

Component: *Grade 5 Teacher Guide*

ISBN: 9781323223369

Current Page Number(s): 12

Location: blue box

Original Text: Objectives

Students will measure and observe physical properties. Students will compare and contrast matter based on physical properties.

Updated Text: Objective

Students will work with phenomena, hands-on and literacy stations, and key ideas to measure and observe physical properties of matter and compare and contrast matter based on its physical properties.

Component: *Grade 5 Teacher Guide*

ISBN: 9781323223369

Current Page Number(s): 15

Location: Address Prior Knowledge

Original Text: Review the exit tickets collected from the Engage activity. Identify prior knowledge about the properties of matter.

Updated Text: Review the exit tickets collected from the Engage activity. If the exit tickets reveal gaps in understanding or misconceptions, use this scaffolding and guidance for just-in-time learning acceleration.

Component: *Grade 5 Teacher Guide*

ISBN: 9781323223369

Current Page Number(s): 16

Location: major column, starting at Guide Student Planning

Original Text: GUIDE STUDENT PLANNING Remind students that it is important that they follow the directions closely and to carefully record their measurements and observations for each material so they can draw conclusions at the end.

Encourage students to make predictions about what material will have the properties the company wants. Ask:

- What properties should Toy 1 have? Which material do you think will be best for Toy 1?
- What properties should Toy 2 have? Which material do you think will be best for Toy 2?
- How will you test the materials?

DIFFERENTIATED INSTRUCTION

Measuring Mass To reinforce understanding, model how to use a balance or scale to find an object's mass. If using a balance, model how to zero the balance by moving all the sliders to the left along the beams. Point out that the pointer is right at the zero line. Place a block on the balance platform. Ask What happened to the pointer? (It moved away from the zero line.) Model how to find the mass of the block by moving the sliders. Explain how to calculate the mass. If using a digital scale, point out how to tare the scale or how to zero out the scale. Place a block on the balance pan and explain how to read the display.

Original Text: Listening 2D Write property and mixture on the board and say the words.

Have students repeat after you. Encourage students to monitor their understanding of spoken language and ask for clarification as needed.

- Beginning Have students write the words sand and iron on index cards. Then make simple statements that describe the properties of iron or sand before and after they are mixed. Have students hold up the index card to show which substance has that property.
- Intermediate Have students describe to a partner one property of iron or sand before and after they are mixed. Then have students switch roles.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

- Advanced Have student pairs take turns asking and answering questions about the properties of iron and sand before and after they are mixed.
- Advanced High Have students discuss their experiences with other mixtures that maintain the properties of their ingredients.

Updated Text: Listening 2D Write property and mixture on the board and say the words. Have students repeat after you. Monitor student understanding of vocabulary by asking questions.

- Beginning Model or list the properties of iron or sand. Ask simple yes/no questions to monitor if students can identify properties of metals.
- Intermediate Have students describe to a partner one property of iron or sand before and after they are mixed. After listening to a partner, monitor how students respond using the following sentence frames: I heard you say ____; I think ____ is an example of ____ because _____. Then have students switch roles.
- Advanced Have student pairs take turns asking and answering questions about the properties of iron and sand before and after they are mixed. As students listen to others, remind them to ask themselves questions such as: Do I understand what this person is saying? Monitor if a student knows what that word means.
- Advanced High Have small groups pantomime mixing and separating the sand and iron filings. Monitor how each student acts out the process, and have other students narrate the actions.

Original Text: Preview the Topic

In this topic, students learn about force and motion. First, in Experience 1, students investigate and explain how equal and unequal forces acting on an object cause patterns of motion and transfer of energy. Then, in Experience 2, students investigate the effect of force on an object in a system.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video of a rocket taking off, and then explore the effects of different forces on objects in a system to explain how a rocket lifts off the ground. As students progress through the Experiences, they will revisit the Anchoring Phenomenon question, How does the rocket lift off the ground?

Topic Readiness Test

Students answer questions to show what they already know about force and motion by completing a printed or online Topic Readiness Test.

Teacher Background

Watch the Teacher Background Video Force and Motion to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Equal forces have the same strength. Unequal forces have different strengths.
- Unequal forces can change an object's motion by causing it to speed up, slow down, change direction, change position, or stop.
- Some forces can move objects because they transfer energy to them.
- Mechanical energy is the sum of kinetic energy and potential energy.

In this topic, students learn that energy is everywhere and can be observed in cycles, patterns, or systems. First, in Experience 1, students investigate and describe energy transformations in systems. Then, in Experience 2, students explore electrical energy in the context of circuits and energy transformation. Finally, in Experience 3, students explore and explain how light travels.

Topic Readiness Test

Students answer questions to show what they already know about energy by

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1520 of 3538

completing a printed or online Topic Readiness Test.

Teacher Background

Watch the Teacher Background Video Energy to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Energy transformation refers to the change from one form of energy to another, such as the conversion of electrical energy to light energy.
- Reflection occurs when light bounces off of a surface.
- Refraction occurs when light passes through a type of material and changes direction.
- Absorption occurs when light is taken in by a material so that it is not reflected.

Updated Text: Preview the Topic

In this topic, students learn that energy is everywhere and can be observed in cycles, patterns, or systems. First, in Experience 1, students investigate and describe energy transformations in systems. Then, in Experience 2, students explore electrical energy in the context of circuits and energy transformation. Finally, in Experience 3, students explore and explain how light travels.

(new second paragraph in Preview the Topic here)As you progress through the topic, connect the activities back to Topic 1 Matter and Topic 2 Forces and Motion. Students can apply what they learned in Topic 1 about materials that conduct or insulate electric energy (TEKS 5.6A) to what they learn in Topic 3 about the transformation of energy in systems and circuits. They can use what they learned in Topic 2 about patterns of motion (TEKS 5.7A) to what they learn in Topic 3 about how complete circuits can transform energy into motion (TEKS 5.8B).

Topic Readiness Test and Remediation

Students answer questions to show what they already know about Matter by completing a printed or online Topic Readiness Test. For students who have difficulty on the test, assign the corresponding remediation items on Realize.

Location: Address Prior Knowledge

Original Text: Review the exit tickets collected from the Engage activity. Identify prior knowledge about the components of an electrical circuit and how they function.

Updated Text: Review the exit tickets collected from the Engage activity. If the exit tickets reveal gaps in understanding or misconceptions, use this scaffolding and guidance for just-in-time learning acceleration.

Component: *Grade 5 Teacher Guide*

ISBN: 9781323223369

Current Page Number(s): 80

Location: major column, starting at SAFETY

Original Text: SAFETY Have students wear safety goggles and use care when working with glass bulbs and circuits. Instruct students to disconnect the circuit after short use to demonstrate safe practices during investigations as outlined in Texas Education Agency–approved safety standards.

WHAT TO EXPECT Students design and build two different circuits that will both light up two LED bulbs. Encourage groups to talk to other groups to share ideas and get help. As needed, assist students with building a series circuit and a parallel circuit.

GUIDE STUDENT PLANNING Explain to students that it is useful to draw a plan for the two circuits before they begin to ensure that their circuits are different.

GUIDED INQUIRY PROCEDURE If students are having difficulty designing their circuits, suggest these steps to model and support the inquiry process:

1. Use the alligator clips to connect the ends of the wires to the battery.
2. Follow your plan to arrange the 2 LED bulbs to form a series circuit and attach the wires to the bulbs. Note if both bulbs light up. Revise the design if needed and record observations in the activity.
3. Record the diagram of the successful set up in the activity. Include labels for the bulbs, batteries, and wires.
4. Use the plan to rearrange the 2 LED bulbs to form a parallel circuit and attach the wires to the bulbs. Note if both bulbs light up. Revise the design if needed and record observations in the activity.
5. Repeat Step 3.

(1 DIFFERENTIATED INSTRUCTION Note)

Updated Text: SAFETY Have students wear safety goggles and gloves and use care when working with glass bulbs and circuits. Original Text: Objective

Students will demonstrate and explain that light travels in a straight line and can be reflected, refracted, and absorbed.

Updated Text: Objectives

Students will demonstrate and develop explanations that light travels in a straight line and can be reflected, refracted, and absorbed.

Students will use scale, proportion, and quantity to describe, compare, or model how light travels in a straight line and can be reflected, refracted, and absorbed.

Component: *Grade 5 Teacher Guide*

Help prepare your students for standardized testing! Conduct a short mini-lesson on the test-taking strategy of Using Information from the Text:

- Tell students that as they read a text, they should look for key ideas and important details. This information will help students understand what the text is mostly about, and students should take notes to keep track of the ideas.
- Instruct students to read a question on their TEKS Practice Activity and all of the associated answer choices. Before students read the question and answer choices a second time, tell them to reread their notes and look back at the text, as needed, to make sure they clearly understand what the text is mostly about.
- Suggest that students also highlight or underline important ideas and details in the text as they read to help them identify key ideas throughout the question and answer choices.
- As students complete pages in the workbook, remind them to make sure they understand both the question and the answer choices.
- When students determine the correct answers, have them explain how using information from the text helped them. Remind students that they can use the strategy of using information from the text on any quizzes or tests.

Location: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about patterns related to Earth’s rotation. First, in Experience 1, they demonstrate how Earth rotates on its axis and explain how this rotation is related to the day–night cycle and the appearance of the sun moving across the sky. Then, in Experience 2, students investigate how the movement of the sun across the sky causes changes in shadow positions and shape.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of shadows moving throughout the course of a day. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, How do shadows move?

Topic Readiness Test

Students answer questions to show what they already know about Earth and space by completing a printed or online Topic Readiness Test.

Teacher Background

Watch the Teacher Background Video Earth and Space to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- Rotation is spinning in a circle around an axis. Earth completes one rotation about its axis every 24 hours.
- Earth’s rotation causes the day–night cycle and the apparent movement of the sun across the sky.
- A shadow is a dark area formed when light is blocked by an object.
- As Earth rotates, sunlight strikes the surface of the planet at different angles.

These different angles cause shadows to move throughout the day.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience, as well as classroom management strategies to make every Science Experience a success!

Updated Text: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about patterns and processes on Earth and natural resources. First, in Experience 1, they explain how the sun and the ocean interact in the water cycle and affect weather. Next, in Experience 2, they identify and model how Earth's surface changes. Then, in Experience 3, they describe and model processes that lead to the formation of sedimentary rock and fossil fuels. Finally, in Experience 4, they explore how using natural resources impacts the environment.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to the Anchoring Phenomenon Video of snorkelers finding and removing trash from the ocean. As students progress through the Experiences, they will answer the Anchoring Phenomenon question, How can we impact the environment in Texas?

Topic Readiness Test

Students answer questions to show what they already know about patterns on Earth by completing a printed or online Topic Readiness Test.

Teacher Background

Watch the Teacher Background Video Patterns on Earth to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- The water cycle is the way water moves around Earth in different forms. The sun provides energy that warms water, causing some water to evaporate into the atmosphere. Water falls back to Earth as precipitation.
- Weathering is the process by which Earth's surface is broken down into sediment. Erosion is the process by which sediment is removed from land. Deposition is the laying down of sediment.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1532 of 3538

- Sedimentary rocks are a type of rock that forms when many layers of sediment build up in one place and harden over a long period of time. Fossil fuels are substances formed from the remains of ancient organisms.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- **Glaciers are the same as icebergs.** Explain that glaciers are huge sheets of ice that move very slowly across land and contribute to the weathering and erosion of rocks in their path. Icebergs are large chunks of ice that may have been part of a glacier but have broken off and float in the ocean.
- **Plastics are disposed of only on land and retain their original shape and size.** Explain that plastic can be broken into smaller pieces and moved to different locations, including bodies of water.

Help prepare your students for standardized testing! Conduct a short mini-lesson on the test-taking strategies of Anticipating the Answer or Using the Process of Elimination:

- Tell students that before they decide which of these strategies to use, they should read the question to determine whether it is asking about content they know well or content they do not know very well.
- Explain to students that when they know the content well, they can use the strategy Anticipating the Answer. Before looking at any of the answer choices, students should reread the question and try to answer it in their head. Then they should compare their own answer with the choices provided. Students may be able to quickly identify the correct choice this way. This strategy is especially useful for questions that test vocabulary.
- When students do not know the content very well, they can Use the Process of Elimination strategy to help them. Students should first look at each answer choice and remove the choices that are least likely to be correct. Once they have two answers left, they should reread the question and select the better of the two remaining choices.
- Remind students that many tests are timed, so for either strategy, students should be mindful of time management. They should not spend too long on any one question so that they are able to complete the whole test in a timely manner.

Then they should compare their own answer with the choices provided. Students

Proclamation 2024: Report of Editorial Changes (11/08/2023)

may be able to quickly identify the correct choice this way. This strategy is especially useful for questions that test vocabulary.

- Students can also use the strategy Use the Process of Elimination. Students should first look at each answer choice and remove the choices that are least likely to be correct. Once they have two answers left, they should reread the question and select the better of the two remaining choices.

Location: Preview the Topic

Original Text: Preview the Topic

In this topic, students learn about patterns, cycles, systems, and relationships within environments and ecosystems. First, in Experience 1, students describe how organisms survive by interacting with biotic and abiotic factors in a healthy ecosystem. Then, in Experience 2, students explain and predict how changes in an ecosystem can affect the cycling of matter and the flow of energy in a food web. Finally, in Experience 3, students describe a healthy ecosystem and explain how human activities can be beneficial or harmful to an ecosystem.

PREVIEW ANCHORING PHENOMENON

Students watch and respond to a short Anchoring Phenomenon Video of animals crossing a wildlife bridge. As students progress through the Experiences, they will use sense-making activities to help them answer the Anchoring Phenomenon question How can animals live safely near roads in Texas?

Topic Readiness Test

Students answer questions to show what they already know about ecosystems by completing a printed or online Topic Readiness Test.

Teacher Background

Watch the Teacher Background Video Ecosystems to refresh your knowledge of topic content. Key concepts to support instruction of this topic:

- An ecosystem consists of all the organisms living in a particular place as well as the nonliving parts of the environment.
- Biotic refers to the living or once-living parts of an ecosystem. Abiotic refers to the parts of an ecosystem that are nonliving and have never been living.
- A healthy ecosystem contains suitable types and amounts of biotic and abiotic factors needed to support the organisms that live there.

Teacher Prep

In addition to the Teacher Background Video, there are Teacher Prep Videos to help you prepare for every Experience. These include a preview of the Experience as well as classroom management strategies to make every Science Experience a success!

Common Misconceptions

As students explore the content, be attentive to common misconceptions that may arise and address as needed. Common misconceptions are listed in bold type. The subsequent text explains the misconceptions.

- An ecosystem is simply a collection of organisms living together. Reinforce the concept that an ecosystem includes not only biotic and abiotic factors, but also the interactions between living and nonliving organisms in their environment.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1540 of 3538

- Organisms higher in a food web eat all the organisms lower in the food web. Explain that organisms higher in the food web may eat some, but not necessarily all, of the organisms below them in the web. For example, consumers at the top of a food web would not necessarily eat plants, and certainly not all plants.

Original Text: Objective
Students will observe and describe how a variety of organisms survive by interacting with biotic and abiotic factors in a healthy ecosystem.

Updated Text: Objectives

Students will observe and describe how a variety of organisms survive by interacting with biotic and abiotic factors in a healthy ecosystem.

Students will listen actively as the class compares terrarium designs and decides on one design the whole class could use to build a habitat for worms.

Component: *Grade 5 Teacher Guide*

ISBN: 9781323223369

Current Page Number(s): 167

Location: Address Prior Knowledge

Original Text: Review the exit tickets collected from the Engage activity. Identify prior knowledge about the living and nonliving resources organisms need to survive in their ecosystems.

Updated Text: Review the exit tickets collected from the Engage activity. If the exit tickets reveal gaps in understanding or misconceptions, use this scaffolding and guidance for just-in-time learning acceleration.

Component: *Grade 5 Teacher Guide*

ISBN: 9781323223369

Current Page Number(s): 168

Location: major column, starting at WHAT TO EXPECT

Original Text: WHAT TO EXPECT Students will conduct research to determine what earthworms need to survive. They will draw a design for a terrarium that will be an ecosystem for earthworms and explain why specific items were included. Students will then compare plans as a class and decide on one design the whole class could use to build a small habitat for earthworms.

GUIDE STUDENT PLANNING Remind students that an ecosystem contains both living and nonliving things. Point out that animals live in areas where the temperature and moisture are suitable to their needs. Encourage students to include these conditions in their research. Ask:

- Where do earthworms usually live?
- What are the characteristics of their natural habitat?
- What living and nonliving things do earthworms need to survive?

GUIDED INQUIRY PROCEDURE If students need help to design their ecosystem, suggest these guided inquiry steps to model and support the inquiry process:

1. Place soil and sand in the container in alternating layers. Start with a layer of

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1542 of 3538

sand on the bottom and finish with a layer of soil. Leave some empty space at the top of the container for food items.

2. Spray the top of the container with water in a spray bottle so the air inside the container stays humid. Continue spraying water on the soil until it is moist.
3. Place plant clippings or leaf litter on top of the soil.
4. Put a lid with holes in it on top of the container.
5. Store the terrarium in a well-lit space out of direct sunlight.
6. Using a spray bottle, add water to the habitat every few days so the soil stays moist.

Original Text: GUIDE STUDENT PLANNING Remind students that it is important that they follow the directions closely and carefully. Encourage students to make predictions about how changes in the ecosystem would affect the organisms that live there.

Ask:

- How might changes in water quality affect the health of animals that live in a coastal ecosystem?
- How could you model the flow of energy in a coastal ecosystem?

GUIDED INQUIRY PROCEDURE If students are struggling to design their model, suggest these guided inquiry steps to model and support the inquiry process:

1. Arrange the cards with the organisms that produce their own food at the bottom of the desk.
2. Place cards above other cards to show what organisms eat.
3. Attach yarn to the cards to show which organisms eat other organisms.
4. The cards should be arranged as follows, top to bottom: bull sharks; king mackerel and blackfin tuna; pink shrimp and copepods; diatoms and dinoflagellates.

DIFFERENTIATED INSTRUCTION

Developing Models To help students set up the activity, begin by placing the diatoms card at the bottom of the table or desk. Ask What organisms eat diatoms? Place the cards for pink shrimp and copepods above the card for diatoms, and model how to connect the cards with string. Ask What other organisms are producers? (dinoflagellates) Ask students where the card for dinoflagellates should be placed and which cards should be connected to it.

Component: *Grade 5 Teacher Guide*

ISBN: 9781323223369

Current Page Number(s): 179

Location: ELPS TARGETED SUPPORT

Original Text: Learning Strategies 1F, Listening 2I Have students demonstrate listening comprehension by summarizing information about organisms and food chains.

- Beginning Ask simple yes/no questions about the interactions between organisms in the food chain. Further, encourage students to use accessible language as they are able.
- Intermediate Have students summarize the interactions between the organisms in the food chain to a partner. Students should use the words producer, consumer, and decomposer in their sentences. Then have students switch roles.
- Advanced Have students discuss with a partner the cycling of matter through the food web. Students should demonstrate understanding of the terms producer, consumer, and decomposer in their sentences.
- Advanced High Have students take turns summarizing a specific change in the food web and how that change would affect the flow of energy through the ecosystem.

Updated Text: Learning Strategies 1F, Listening 2I Display a simple food chain or food web. Have students demonstrate listening comprehension by following increasingly complex directions as needed throughout the summarizing activity about organism interactions.

- Beginning Instruct students to point to producers, consumers, and decomposers when prompted. Further, encourage

students to use accessible language as they are able. Monitor for the student's ability to follow your directions in order to complete the task.

- Intermediate Instruct students to write the letter “P” beside producers, the letter “C” beside consumers, and the letter “D” beside decomposers on the model. Monitor for the student's ability to follow your directions in order to correctly label all of the organisms present.
- Advanced Verbally instruct students to choose three colors with which to represent producers, consumers, and decomposers. Instruct students to create a legend that explains what each color will represent (for example, green may represent producers). After students have created a legend, instruct students to circle the producers, consumers, and decomposers in their chosen colors. Monitor for the student's ability to follow your directions in order to create the legend and circle the correct organisms.
- Advanced High Verbally instruct students to draw one additional producer, consumer, and decomposer on the food web, label each organism accordingly, and include arrows indicating the flow of energy to and from each additional organism. Monitor for the student's ability to follow this complex set of directions in order to complete the complex task provided.

Original Text: (Census Pie Charts)

Based on the data in the graph, which conclusion is reasonable from the 2020 census versus the 2010 census?

- a. A larger percentage of white people voted in 2020.
- b. A smaller percentage of Asian people voted in 2020.
- c. A larger percentage of Hispanic people voted in 2020.
- d. An equal number of African Americans voted each year.

Updated Text: (World Population Pie Charts)

Which conclusion is reasonable based on the data in the pie charts?

- a. A larger percentage of the world's population lived in Europe in 2019 than in 1950.
- b. A smaller percentage of the world's population lived in Asia in 2019 than in 1950.
- c. A larger percentage of the world's population lived in Africa in 2019 than in 1950.
- d. A smaller percentage of the world's population lived in South America in 2019 than in 1950.

Original Text: The vocabulary terms that students need to know are:

conductivity: a property of matter than describes materials that allow electricity to flow

displace: when a substance or object pushes out water to make room for itself

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1572 of 3538

insoluble: substances that do not dissolve in water

insulation: a property of matter that describes material stops the flow of electricity

magnetism: an attracting or repelling force between two objects

mixture: the process of combining two or more substances

property: the quality or how we describe something

solubility: the ability to dissolve

soluble: substances that dissolve in water

Updated Text: (Removed: conductivity, displace, insoluble, insulation, magnetism, solubility, soluble; Added: magnetic; Adjusted definitions for: mixture, property)

Review the following terms:

magnetic: attracted or repelled by a magnet

mixture: a combination of two or more substances. Each substance keeps its own physical properties and can be easily separated.

property: a characteristic of a given material

Original Text: (PDF pg. 1)

I can demonstrate that some matter is conserved in solutions by comparing the mass before and after.

(PDF pg. 2)

The vocabulary terms that students need to know are:

mixture: the process of combining two or more substances

property: the quality or how we describe something

solution: mixture of two or more substances that can not be separated

conserve: to avoid wastefulness

Updated Text: (PDF pg. 1)

I can demonstrate that some matter is conserved in solutions by comparing the mass before and after being combined.

(PDF pg. 2)

Review the following terms:

(Adjusted definitions for mixture, property, and solution; changed "can not" to "cannot" in the definition of solution)

mixture: a combination of two or more substances. Each substance keeps its own physical properties and can be easily separated.

property: a characteristic of a given material

solution: mixture of two or more substances that cannot be separated

conserve: maintain or stay the same

Original Text: (n/a)

Updated Text: (Added Applied Science Writing prompt and sample answer. See below.)

Applied Science Writing

Have students write in their student edition about an energy transformation they can observe in a system in their home, school, or community.

Answers may vary. Example: In my house, we have a toaster plugged into the wall. The toaster is a system made of components. It has a cord, which is plugged into the wall, where it gets electricity. When the button is pushed down on the toaster, the electrical energy is transformed into thermal energy. I know this because I feel the toaster getting hot, and my bread gets toasted. There is also an energy transformation from electrical energy to light energy because I can see the coils inside getting red when they get hot. The coils are metal, so they conduct the thermal energy from the toaster to the bread. This gives me toast.

Original Text: (1) These circuits provide us with motion, light, sound, and heat.

(2) Examples of conductors include most metals and water.

(3) (N/A)

(4) Consider plugging a fan into an outlet.

(5) Similarly, when you plug in an electric tea kettle, the electrical energy transforms into thermal energy and heats the water inside the kettle.

Updated Text: (1) These circuits provide us with energy in the form of electricity that can be transformed into motion, light, sound, or heat.

(2) Examples of conductors include salt or tap water and most metals, such as copper, silver, and aluminum.

(3) In this example, the light bulb would stay lit continuously. In order to turn the light on and off, a switch would be needed. When the switch is closed, the circuit would be complete and the bulb would light up. When the switch is opened, the circuit would be incomplete and the bulb would be unlit.

(4) Consider plugging a fan into an outlet and turning on (or closing) the switch.

(5) Similarly, when you plug in an electric tea kettle and turn on (or close) the switch, the electrical energy transforms into thermal energy and heats the water inside the kettle.

Original Text: (n/a)

Updated Text: Investigation Questions: How does the sun affect weather? Explain.

Answers may vary. Example: The sun heats the ocean causing liquid water to evaporate into water vapor (gas). Eventually, the water vapor rises high into the atmosphere, cools, and condenses into clouds. When clouds become too heavy, precipitation occurs.

How does the ocean affect weather? Explain.

Answers may vary. Example: Oceans are the largest sources of water on Earth. Without ocean water, much less liquid would be heated by the sun. This would result in very little precipitation.

Original Text: Streams

(Image of a Stream)

Streams make up an important part of a healthy ecosystem. They are home to different types of fish, frogs, and even some plants, such as algae. Streams also provide drinking water to a variety of forest animals, such as squirrels and deer. Beavers build dams and lodges in streams to sleep, stay warm, hide from predators, and raise their babies. Predators, like some birds and bears, use rivers to hunt for fish. The temperature of the water in a stream affects how well algae can create its own food. If the temperature of the water is warmer and there is more sunlight shining on the stream, the algae can thrive and create more nutrients for other organisms.

Updated Text: Great Horned Owl

(Image of Great Horned Owl and Owlets)

Great Horned Owls are mighty forest predators. These skilled hunters feed on a variety of other forest creatures, such as mice, rabbits, and snakes. They build their nests high in trees where they raise their young, safely hidden by leaves and tree branches. By using different calls, or hoots, Great Horned Owls communicate a variety of messages to other owls in the area. Great Horned Owls are nocturnal creatures, meaning they do most of their hunting at night. Under the cover of darkness, these amazing creatures glide silently through the air to catch their next meal. These unique birds also adjust their behaviors to thrive in a variety of temperatures. For instance, in overcast, cool weather, they may hunt earlier in the day while their prey is more active.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1605 of 3538

Original Text: (PDF pg. 2)

Matter Model

How does matter cycle through a wolf's food web?

(PDF pg. 5)

Questions

How did the removal of the top predator in the food web affect the population of organisms below it?

(There were more of the animals that wolves eat and fewer of other plants and animals.)

Predict how the change in population of organisms in the ecosystem would affect the cycling of matter and flow of energy in the food web.

(With a decrease in the population of many animals, there would be less matter to cycle in the food web. With the increase in elk, too many plants would be eaten. With fewer plants, there would be less energy to flow in the food web.)

How does the removal of a top predator affect stability in an ecosystem over time?

(The ecosystem isn't stable. There are too many elk and not enough plants or other animals. Animals would not have enough to eat, and they would die. Eventually, there wouldn't be enough plants, and the elk would die, too.)

Updated Text: (PDF pg. 2)

Matter Model

Draw a revised model of the wolf's food chain from Activity 2 to show how matter cycles through a wolf's food web.

Write a sentence beneath your model explaining why this is a cycle.

(PDF pg. 5)

Original Text: Unit 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

The student understands that recurring themes and concepts provide a framework for making connections across disciplines

Updated Text: Unit 1 – Scientific and Engineering Practices

The student asks questions, identifies problems, and plans and safely conducts classroom, laboratory, and field investigations to answer questions, explain phenomena, or design solutions using appropriate tools and models.

The student analyzes and interprets data to derive meaning, identify features and patterns, and discover relationships or correlations to develop evidence-based arguments or evaluate designs.

The student develops evidence-based explanations and communicates findings, conclusions, and proposed solutions.

The student knows the contributions of scientists and recognizes the importance of scientific research and innovation for society.

The student understands that recurring themes and concepts provide a framework for making connections across disciplines.

Note: Content for TEKS 1 to 5 appears within all other Units.

Examples are provided in the Texas Essential Knowledge and Skills section and detailed in correlations.

Original Text: N/A

Updated Text: Idea Boxes

Idea boxes placed throughout the chapter text function to provide opportunities for collaborative discussion of content, review of content introduced, and focus on certain content that is harder to grasp. Guidance on how to use the idea boxes can be found in the Comprehension Skills section. However, before reading each chapter prepare for the idea boxes by:

- Reviewing the chapter and idea boxes and planning for the time taken for each box to be implemented (guidance on how long each idea box will take to implement can be found in the Learn by Doing Activity Reader Books Scope and Sequence that can be found in the TPS Online Library Teacher Support).
- Reading the chapter and planning where in the text to stop for the Idea box; this should be an appropriate break from the text that can be used to implement the idea box.
- Planning to have at hand any materials needed to implement the Idea box.
- Reviewing the task information contained within the Idea boxes.

Original Text: Students may think that a larger marshmallow will travel farther because it has more mass. But the same amount of energy is transferred from the spoon to a large marshmallow as a small marshmallow. Therefore, the larger marshmallow does not travel as fast because of its size, so it does not go as far. Reinforce this concept as students work through the discussion questions.

Updated Text: Students may think that a larger object will travel farther because it has more mass. But the same amount of energy is transferred from the spoon to a large object as a small object. Original Text: Where can you observe these two types of energy in your catapult system? The bent plastic spoon has elastic potential energy. When the marshmallow launches and is moving, it has kinetic energy.

How does your catapult show that energy can transfer and change forms (transform)? The potential energy stored in the catapult when its arm was bent was transferred to the marshmallow when it was launched. Potential energy from the catapult transforms into kinetic energy in the moving marshmallow.

What factors affect how far a marshmallow travels? The more the arm is pulled back, the farther the marshmallow travels. The less mass of the marshmallow, the farther it travels.

Updated Text: Where can you observe these two types of energy in your catapult system? The bent plastic spoon has elastic potential energy. When the object launches and is moving, it has kinetic energy.

Current Page Number(s): 32

Location: Interact

Original Text: Launch the interactive and complete the following:

1. Select a protist.
2. Read the information about how the protists in that category obtain their food or move around.
3. Select another protist until all categories have been explored.
4. Complete the data table.

Updated Text: Interact: Delete existing instructions. New instructions:

1. Select a way in which protists move.
2. Read the information about how protists move this way.
3. Select a method of how protists get food.
4. Read the information about how protists get food this way.
5. Note the type of protists that move and get their food in this way.
6. Select other ways in which protists move and get their food until all protists.
7. Use the information to infer which protists are unicellular or multicellular, and which are . autotrophs or heterotrophs.
8. Record your results from the interactive in the table.

instead of mixing with the other liquids. We also know that density is a measure of how much mass is in a given unit of volume. Substances that are denser will sink, and substances that are less dense will float. This means that the honey has more mass per unit of volume, so it sits at the bottom of the column. On the other hand, the kerosene has the least mass per unit of volume, which is why it sits at the top of the column and won't sink down and mix with the other substances.

Updated Text: Revised Explanation Now that you have learned more about the rainbow column, write a final explanation for this phenomenon. Original Text: Understanding why the cube and feather landed at different times in the air but at the same time in the vacuum will require thinking about the cause-and-effect relationships between forces and objects. In considering each case, you will need to think about events and the possible connections that can explain predictable changes with regard to the motion of objects.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1652 of 3538

Ask students how they think cause and effect are related to each other. As students share their thinking, you may ask them to provide an example of how they think these terms are related. You may suggest that they state the effect first and then what caused it. For example, the playground is wet (effect). This happened because a thunderstorm had just passed over the playground (cause). If students do not share why the playground is wet when the thunderstorm passes, then ask, why does the playground get wet when the thunderstorm passes? This gets students thinking about the underlying mechanism or process for how the cause brings about the effect.

As students begin to organize their ideas about causes of the feather and the cube landing at the same time in the vacuum, have them think about how each of those causes makes the effect happen. Asking students to focus on how the cause brings about the effect gets them thinking about how cause and effect are connected.

Updated Text: Understanding why the cube and feather landed at different times in the air but at the same time in the vacuum will require thinking about the cause-and-effect relationships between forces and objects. In considering each case, you will need to think about events and the possible connections that can explain predictable changes with regard to the motion of objects.

Original Text: Beginning

Have students play the interactive several times. Stop the interactive frequently to check for understanding. Have students use the text to speech tool to listen to the text and read simultaneously. Have students use sentence frames to describe what happens with one, two, and three shooters. With one shooter, the amount of potential energy at the beginning is _____. The amount of kinetic energy transferred is _____. With two shooters, the amount of potential energy at the beginning is _____. The amount of kinetic energy transferred is _____. With three shooters, the amount of potential energy at the beginning is _____. The amount of kinetic energy transferred is _____.

Intermediate

Have students play the interactive allowing them to repeat it as necessary. Have students use the text to speech tool to listen to the text and read simultaneously. Then have students look at their data table to describe their observations. Allow students to use the following sentence frames or their own words to share their ideas with the class. According to the interactive, with one shooter, the amount of potential energy at the beginning is _____, and amount of kinetic energy transferred is _____. The energy is transformed from potential to kinetic _____. The kinetic energy is transferred when _____.

Advanced

Have students take notes of key ideas as they run the interactive. Then, have students work with a partner to describe the two types of energy and when and where energy is transformed or transferred. Students should record their answers and report to the class. One partner should serve as recorder and one as reporter.

Advanced High

Have students take notes of key ideas as they use the interactive. Then have students describe with a partner the two types of energy and when and where energy was transformed or transferred. After the partner discussion, have students share answers with the class.

Updated Text: In this activity, you will be collecting quantitative data. Quantitative data refers to information or observations that can be measured and expressed numerically. It involves collecting and analyzing data in the form of numbers. Examples of quantitative data include measurements of size, mass, temperature, volume, and time. Some quantities such as mass are measured with the International System of Units (SI). These are standard units used by scientists everywhere.

Original Text: We at Green Ninja are very excited to welcome you to our Grade 6 curriculum for Texas! Our materials are designed around the updated TEKS and ELPS. We take to heart the notion that giving students opportunities to work on real-world problems can promote science learning and student engagement and a full description of the research behind the curriculum and the instruction design is provided at <https://www.greenninja.org/texas/>. The core of the curriculum is helping to make science fun and interesting for students. Student motivation is a critical component of learning, so our goal is to help teachers make their classes as engaging for students as possible. We recognize that beginning to teach a new curriculum is not always a smooth process, so we've tried to make this shift to new territory as easy as possible. If you have any questions or comments, urgent or non-urgent, or anywhere in between, please send us a message (e.g., via

the Contact Us button on each webpage or email at contact@greeninja.org).

Grade Storyline

The theme for Grade 6 is Earth Systems. A brief outline of the year-long sequence of units and the associated culminating experiences is provided below.

The year begins with Unit 1, Minerals, where students learn about the components of a smartphone by dismantling one and learning where the parts came from. They build an awareness of the increased use of Earth's resources in smartphones in order to meet the growing demand. They discover how the periodic table is organized and then explore the physical properties of elements used in smartphones. The formation of rocks is seen to be a continuous cycle using materials from deep inside the Earth. The culminating project asks students to design a more sustainable smartphone.

In Unit 2, Ecosystems, moves on to focus on living things and how they interact with the Earth systems around them. A personal ecosystem study location will provide students with the opportunity to be a real ecologist, learning about one small ecosystem by making observations over time, and collecting and analyzing data. Students will also observe how a change in one part of a system can affect other parts of the system. The Carbon Command game shows how the atmosphere, oceans, land surface, and ice are all interacting systems. The importance of traits and variation to survival will also be observed. In the culminating project, students write letters of thanks to local managers of their particular ecosystem study location.

Reducing Pollution and Waste is Unit 3. The start of the unit focuses on trash going into landfills and students begin a personal trash diary. This gives them real data to use when planning how to reduce the amount of trash they generate. Pollution is detrimental in many ways, and in this unit cell theory shows how pollution travels through a watershed, and ultimately enters plants. In the culminating project, students suggest an action plan to reduce pollution and waste thus keeping the environment healthy.

Earth From Space is Unit 4 where students begin with a broad view of Earth from a distance, and then bring that view closer to Earth itself to see how Earth's landscape has been changed by human consumption. Students will learn about waves as they consider satellites and the data they provide. Earth's resources are not infinite so students research how resources can be managed sustainably not only for today but for the future. The culminating project is the design of an infographic to educate others on reducing ecological footprints.

Updated Text: We are excited to welcome you to our Grade 6 curriculum for Texas! Green Ninja's approach learning uses a storyline model where each unit begins with a locally relevant, real-world challenge and culminates in a project in which students showcase how they meet the challenge using the science they've learned in the unit. This is what drives student learning.

As students proceed through the lessons, they'll use various scientific and engineering practices (SEPs) and recurring themes and concepts (RTCs) to help students build a cohesive understanding of science and the core ideas. Additionally, our curriculum meets all English Language Proficiency Standards (ELPS) to ensure that all learners have the opportunity to succeed.

We want to make your teaching experience a success and are here to support you. If you have questions or comments, urgent or non-urgent, or anywhere between, please send us a message via the "Contact Us" button on each webpage or email us at contact@greeninja.org).

Grade Storyline

Each integrated grade level of the Green Ninja Middle School program has a theme, and the theme for Grade 6 is Earth Systems. Unit 1, Minerals, focuses on the geosphere, including the rock cycle and Earth's layers. Unit 2, Ecosystems, expands to include the biosphere and how living things interact in their environment. Unit 3, Reducing Pollution and Waste, follows pollution and trash through different Earth systems including the geosphere, hydrosphere, and biosphere. The final unit, Earth from Space, looks at the Sun-Earth-Moon system to understand phenomena such as tides and

seasons.

We like to think of each unit as a student journey. The journey begins with a challenge, a real-world, locally relevant problem that students are tasked with solving. Students proceed through their journey as they learn the core knowledge through scientific and engineering practices and by utilizing recurring themes and concepts, the three components of the TEKS. The end of the journey is the culminating project, where students showcase how they met the unit challenge. The unit challenge, culminating in an end-of-unit project, is what drives students learning.

Here is a brief outline of the units in Grade 6:

Original Text: "COLLABORATE: Working with a partner, develop an argument that supports or refutes this statement: There is a mathematical formula that represents patterns of density in objects. Use evidence from this lesson and your knowledge of patterns to support your argument. Be creative! Your argument can be in the form of writing, drawing, or an oral presentation.

Students should argue that patterns of density in objects can be found through mathematical formulas. Students could choose to do one or more of the following:

- Describe their argument in writing.
- Develop a mathematical formula showing how to calculate density.
- Communicate their argument orally to the class as part of a discussion or presentation."

Updated Text: "COLLABORATE: Working with a partner, develop an argument that supports or refutes this statement: There is a mathematical formula that represents patterns of density in objects. Use evidence from this lesson and your knowledge of patterns to support your argument.

First, present your argument verbally to a partner. Then, present your argument to your class in written form, such as in a report.

Students should argue that patterns of density in objects can be found through mathematical formulas. Students should communicate their argument verbally to a partner, then present their argument to the class in writing. This could be a written report or an example of a mathematical formula that can be used to calculate density."

Updated Text: "STEP 8, PROPOSE A SOLUTION: How would you improve the design of your parachute? Remember, the goal is to make the object fall as slowly as possible.

Use the following to help optimize your design

- model from STEP 1
- data from your investigation
- results of your classmates
- understanding of how multiple forces can act on and affect an object

[answer] When I compared my parachute and data with those from other groups, I discovered that parachutes with a larger area generally help the object fall slower. To improve my parachute, I would try making it larger, but also more rectangular. This might help air increase air resistance and increase the upward force on the parachute, which would increase the amount of time it takes for the object to fall."

Original Text: n/a

Updated Text: EXPLAIN: What must be true for matter to be conserved in the plant system during photosynthesis? Select all that apply.

- B. The mass of carbon dioxide and water used in the process must equal the mass of sugar and oxygen produced.
- C. The number of hydrogen atoms in the reactants must equal the number of hydrogen atoms in the products.
- D. The mass of carbon in the reactants must equal the mass of carbon in the products.

Matter is conserved in the plant system because the type and number of atoms in the products and reactants of photosynthesis are the same.

Original Text: n/a

Updated Text: EXPLAIN: Explain how matter is conserved in this ecosystem food web. Include an explanation of why the amount of matter that makes up producers may not equal the amount of matter that makes up consumers, but matter is still conserved in the system.

Sample answer: When a consumer eats a producer or other consumer, matter is transferred to the consumer. The amount of matter that the consumer takes in is equal to the amount of matter that the consumer uses to build its own body and conduct life processes, plus the matter it releases to the environment as waste. Because organisms release waste to the environment, it may seem like matter is not conserved in a food web. This is one reason the mass of higher-level consumers in a food web is less than the mass of producers and lower-level consumers. But matter was not destroyed. It was transferred to another part of the system.

Location: Column 2, Gather Data, question and answer text

Original Text: "How do the positions of the Earth, sun, and moon affect daily, weekly, and monthly tidal cycles? Record your data.

Sample answer: The sun and the moon are aligned on the same side of Earth about once a month. When they are aligned, their gravity causes a tide to be higher than usual. When the sun and moon are at a 90° angle relative to Earth, their gravitational forces do not add together, and the tidal range is smaller. The neap tides happen every quarter moon or about twice a month."

Updated Text: "How do the positions of and gravitational forces among the Earth, sun, and moon cause

- daily tidal cycles?
- weekly tidal cycles?
- monthly tidal cycles?

Record your data.

Sample answer: As the moon orbits around the Earth its gravitational pull affects Earth's daily tidal cycle. A bulge occurs on the sides of the Earth closest to and opposite from the moon, resulting in a high and low tide that occurs twice each

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Location: add to bottom of second column

Original Text: n/a

Updated Text: "COLLABORATE: Working with a small group, spend 15 minutes researching an example of resource management being used to reduce poverty. You can use "resource management" and "reduce poverty" as search terms to guide your research.

IDENTIFY: What is the central problem or issue in the example?

DESCRIBE: How did poor resource management contribute to the problem in the example?

ANALYZE: How is the problem in the case study related to human economic activities?

EVALUATE: How have resource management decisions reduced poverty in this example?

Sample answer: The central issue in my example is the decrease in wetlands needed for fishing in Bangladesh, India, and the concentration of fishing income to a small group instead of the larger community. Wetlands used for fishing decreased in quality due to improper management, and fishing leases were allowed to be gathered by a small group of people. The decreasing environmental quality in the wetlands is tied to pollution and other impacts from human development. The wetlands were improved by developing sanctuaries, harvest restrictions, fish passages, and increased water movement. Once wetlands were improved in size and quality, fishing opportunities increased, fish caught increased, and the revenue gained from selling the fish helped the poor in the area."

Original Text: "Case Study 2: Pollution in the Atmosphere"

Updated Text: "Case Study: Pollution in the Atmosphere

IDENTIFY: What is the central problem or issue in the case study?

DESCRIBE: How did poor resource management contribute to the problem in the case study?

ANALYZE: How is the problem in the case study related to human economic activities?

EVALUATE: How does the problem in the case study negatively affect people and the environment? How have resource management decisions already reduced the negative effects of the activity on people and the environment?

PROPOSE SOLUTIONS: Identify and describe at least one resource management strategy people could use to improve the problem presented in the case study.

Sample answer: Pollution in the atmosphere is the central problem. Human activities such as the burning of fossil fuels have caused an increase in carbon dioxide in the atmosphere. Too much carbon dioxide in the atmosphere can affect Earth's climate. A changing climate can negatively affect people's health. Increased carbon dioxide in the atmosphere also affects Earth's oceans. Changes to the oceans can harm saltwater organisms that people rely on for food. If people reduce carbon emissions by using alternative sources of energy, the problem could be improved."

Current Page Number(s): p. 454

Location: first column, Make Informed Decisions question and answer text

Original Text: "MAKE INFORMED DECISIONS: Based on credible evidence from your research, what do you think are cost-effective steps that could be taken to reduce global malnutrition? Identify how resource management strategies could be used to assist in this effort.

Sample answer: I think reducing our reliance on large corporate farms and supporting smaller, local food systems would help reduce global malnutrition. These programs would place resource management decisions in the hands of individuals and neighborhoods instead of at higher levels of government and with corporations, so that people can make economic decisions that also benefit the environment and their health."

Updated Text: "MAKE INFORMED DECISIONS

- Name three or more credible sources you accessed during your research.
- Then, describe three or more solutions for reducing global malnutrition that you learned about from your sources.
- Next, evaluate the cost-effectiveness of each solution. A cost-effective solution is one that delivers good results with low costs. Costs could include material costs, implementation costs, environmental impacts, and many more.
- Which solution do you think is the most cost-effective for reducing global malnutrition?

Look for: A list of credible sources such as government, educational, or non-profit websites with expert information about the topic; three or more solutions, such as increasing reliance on smaller farms and local food systems; and an explanation for which solution for reducing malnutrition is most cost-effective."

Location: middle of Column 2, Make Informed Decisions

Original Text: "MAKE INFORMED DECISIONS: Based on credible evidence from your research, what steps do you believe are necessary to reduce air pollution? Identify how resource management strategies could be used to assist in this effort.

Sample answer: I think the government needs to enact laws that require people to use hybrid or electric vehicles and require corporations to develop more technologies that provide clean energy without burning fossil fuels. Governments could provide grants and training to individuals and corporations that want to learn sustainable engineering principles and could provide guidelines and goals for people and corporations to meet."

Updated Text: "MAKE INFORMED DECISIONS: Fill in the table to document the sources you found and the methods of research those sources used. Then, make an informed decision on which method was the most effective.

[insert table]

[col 1] Source [col 2] Method Used

[row 1]

[row 2]

[row 3]

Look for: Student responses should include three sources, the methods of research those sources used, and a decision about which method was the most effective."

Support for Student Answers

Research solutions for reducing poverty through resource management.

- Farm workers use soil and water to grow crops. People sell trees and animals from forests, use trees and other biomass to fuel cooking fires, and eat and sell fish from fisheries.
- Resource management is related to poverty because many people rely on natural resources for their livelihood. When resources are managed in a way that helps people meet their needs, poverty in an area may be reduced.
- Resource management strategies can help reduce poverty by involving local communities in the management of natural resources and the development of economic policies related to their natural resources. The income poorer communities receive from their natural resources can be increased through tourism or "buy local" initiatives, increasing the productivity of agricultural land, or paying communities to retain areas in their natural states to preserve ecosystem services."

Current Page Number(s): p. 492

Location: second column, collaborate

Original Text: "COLLABORATE: Work with a partner or small group to research landfills and any patterns related to solid waste and landfills in your state or country. Develop a presentation about landfills to educate your community about what happens to their solid waste. Be creative! Your presentation can be in the form of writing, drawing, or an oral presentation.

Look for: Student presentations should include a description of what a landfill is and how it operates. They should include the process of what happens, from disposing of their solid waste through it entering the landfill. Students may mention that it is important to conserve materials because of the effects of solid waste building up in landfills."

Updated Text: "COLLABORATE: Work with a partner or small group to research solutions for reducing solid waste disposal and landfill use in your state or country.

- What sources did you find during your research? How did you know they are credible?
- Describe three current solutions for reducing solid waste disposal.
- Describe at least one solution for reducing solid waste disposal that is not widespread now but may be in the future.
- Evaluate the solutions you described for cost-effectiveness. This is the relationship between how well a solution works and how much it costs.
- Which solution is the most cost-effective way to reduce solid waste disposal?

First, orally communicate your solution to another group. Then present your solution to your class in the form of a drawing, poster, or digital slide show. Work with your teacher or other member of your community to implement your solution.

Look for: Student presentations should include an explanation of the solution they feel is the most cost-effective way to reduce solid waste disposal. Students should use evidence and supporting materials to illustrate why they support this solution. Students may mention that it is important to conserve materials because of the effects of solid waste building up in landfills.

Location: Column 1, Differentiation: Challenge

Original Text: "Challenge students to identify scientific theories that have been dismissed by the public because they are "just theories." For example, Galileo proposed the theory that Earth revolved around the sun, but it was dismissed by people who wanted to believe Earth was the center of the universe. Plate tectonics, handwashing, germ theory, and evolution are other theories that were dismissed. Ask students to research and explain why these scientific theories were eventually accepted."

Updated Text: "Scientists use the word theory to mean a system of ideas supported by scientific testing that explains phenomena. But in nonscientific usage, theory has a less-rigorous meaning that is similar to the meaning of the word idea. For example, someone might say, "I have a theory that my dog can read—it chews up only boxes that are addressed to me." That person is using theory more to mean idea than to mean scientific theory. The theory is not supported by controlled testing and substantial evidence. On the other hand, plate tectonics, handwashing, germ theory, and evolution

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1715 of 3538

are examples of scientific theories because they are supported by an abundance of scientific evidence gathered by many scientists over many years. Challenge students to select a scientific theory of interest and research some of the evidence that supports it."

Original Text: "COLLABORATE: Working with a partner, develop an argument that supports or refutes this statement: There is a mathematical formula that represents patterns of density in objects. Use evidence from this lesson and your knowledge of patterns to support your argument. Be creative! Your argument can be in the form of writing, drawing, or an oral presentation.

Students should argue that patterns of density in objects can be found through mathematical formulas. Students could choose to do one or more of the following:

- Describe their argument in writing.
- Develop a mathematical formula showing how to calculate density.
- Communicate their argument orally to the class as part of a discussion or presentation."

Updated Text: "COLLABORATE: Working with a partner, develop an argument that supports or refutes this statement: There is a mathematical formula that represents patterns of density in objects. Use evidence from this lesson and your knowledge of patterns to support your argument.

First, present your argument verbally to a partner. Then, present your argument to your class in written form, such as in a report.

Students should argue that patterns of density in objects can be found through mathematical formulas. Students should communicate their argument verbally to a partner, then present their argument to the class in writing. This could be a written report or an example of a mathematical formula that can be used to calculate density."

Original Text: N/A

Updated Text: "STEP 8, PROPOSE A SOLUTION: How would you improve the design of your parachute? Remember, the goal is to make the object fall as slowly as possible.

Use the following to help optimize your design

- model from STEP 1
- data from your investigation
- results of your classmates
- understanding of how multiple forces can act on and affect an object

[answer] When I compared my parachute and data with those from other groups, I discovered that parachutes with a larger area generally help the object fall slower. To improve my parachute, I would try making it larger, but also more rectangular. This might help air increase air resistance and increase the upward force on the parachute, which would increase the amount of time it takes for the object to fall."

Original Text: n/a

Updated Text: EXPLAIN: What must be true for matter to be conserved in the plant system during photosynthesis? Select all that apply.

- B. The mass of carbon dioxide and water used in the process must equal the mass of sugar and oxygen produced.
- C. The number of hydrogen atoms in the reactants must equal the number of hydrogen atoms in the products.
- D. The mass of carbon in the reactants must equal the mass of carbon in the products.

Matter is conserved in the plant system because the type and number of atoms in the products and reactants of photosynthesis are the same.

Original Text: n/a

Updated Text: EXPLAIN: Explain how matter is conserved in this ecosystem food web. Include an explanation of why the amount of matter that makes up producers may not equal the amount of matter that makes up consumers, but matter is still conserved in the system.

Sample answer: When a consumer eats a producer or other consumer, matter is transferred to the consumer. The amount of matter that the consumer takes in is equal to the amount of matter that the consumer uses to build its own body and conduct life processes, plus the matter it releases to the environment as waste. Because organisms release waste to the environment, it may seem like matter is not conserved in a food web. This is one reason the mass of higher-level consumers in a food web is less than the mass of producers and lower-level consumers. But matter was not destroyed. It was transferred to another part of the system.

Current Page Number(s): p. 325

Location: Column 2, Gather Data, question and answer text

Original Text: "How do the positions of the Earth, sun, and moon affect daily, weekly, and monthly tidal cycles? Record your data.

Sample answer: The sun and the moon are aligned on the same side of Earth about once a month. When they are aligned, their gravity causes a tide to be higher than usual. When the sun and moon are at a 90° angle relative to Earth, their gravitational forces do not add together, and the tidal range is smaller. The neap tides happen every quarter moon or about twice a month."

Updated Text: "How do the positions of and gravitational forces among the Earth, sun, and moon cause

- daily tidal cycles?
- weekly tidal cycles?
- monthly tidal cycles?

Record your data.

Sample answer: As the moon orbits around the Earth its gravitational pull affects Earth's daily tidal cycle. A bulge occurs on the sides of the Earth closest to and opposite from the moon, resulting in a high and low tide that occurs twice each day. The sun and the moon are aligned on the same side of Earth about once a month. When they are aligned, their gravity causes a tide to be higher than usual. When the sun and moon are at a 90° angle relative to Earth, their gravitational forces do not add together, and the tidal range is smaller. The neap tides happen every quarter moon or about twice a month."

Original Text: n/a

Updated Text: "COLLABORATE: Working with a small group, spend 15 minutes researching an example of resource management being used to reduce poverty. You can use "resource management" and "reduce poverty" as search terms to guide your research.

IDENTIFY: What is the central problem or issue in the example?

DESCRIBE: How did poor resource management contribute to the problem in the example?

ANALYZE: How is the problem in the case study related to human economic activities?

EVALUATE: How have resource management decisions reduced poverty in this example?

Sample answer: The central issue in my example is the decrease in wetlands needed for fishing in Bangladesh, India, and the concentration of fishing income to a small group instead of the larger community. Wetlands used for fishing decreased in quality due to improper management, and fishing leases were allowed to be gathered by a small group of people. The decreasing environmental quality in the wetlands is tied to pollution and other impacts from human development. The wetlands were improved by developing sanctuaries, harvest restrictions, fish passages, and increased water movement. Once wetlands were improved in size and quality, fishing opportunities increased, fish caught increased, and the revenue gained from selling the fish helped the poor in the area."

IDENTIFY: What is the central problem or issue in the case study?

DESCRIBE: How did poor resource management contribute to the problem in the case study?

ANALYZE: How is the problem in the case study related to human economic activities?

EVALUATE: How does the problem in the case study negatively affect people and the environment? How have resource

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Page 1755 of 3538

management decisions already reduced the negative effects of the activity on people and the environment?

PROPOSE SOLUTIONS: Identify and describe at least one resource management strategy people could use to improve the problem presented in the case study.

Sample answer: Pollution in the atmosphere is the central problem. Human activities such as the burning of fossil fuels have caused an increase in carbon dioxide in the atmosphere. Too much carbon dioxide in the atmosphere can affect Earth's climate. A changing climate can negatively affect people's health. Increased carbon dioxide in the atmosphere also affects Earth's oceans. Changes to the oceans can harm saltwater organisms that people rely on for food. If people reduce carbon emissions by using alternative sources of energy, the problem could be improved."

Location: first column, Make Informed Decisions question and answer text

Original Text: "MAKE INFORMED DECISIONS: Based on credible evidence from your research, what do you think are cost-effective steps that could be taken to reduce global malnutrition? Identify how resource management strategies could be used to assist in this effort.

Sample answer: I think reducing our reliance on large corporate farms and supporting smaller, local food systems would help reduce global malnutrition. These programs would place resource management decisions in the hands of individuals and neighborhoods instead of at higher levels of government and with corporations, so that people can make economic decisions that also benefit the environment and their health."

Updated Text: "MAKE INFORMED DECISIONS

- Name three or more credible sources you accessed during your research.
- Then, describe three or more solutions for reducing global malnutrition that you learned about from your sources.
- Next, evaluate the cost-effectiveness of each solution. A cost-effective solution is one that delivers good results with low costs. Costs could include material costs, implementation costs, environmental impacts, and many more.
- Which solution do you think is the most cost-effective for reducing global malnutrition?

Look for: A list of credible sources such as government, educational, or non-profit websites with expert information about the topic; three or more solutions, such as increasing reliance on smaller farms and local food systems; and an explanation for which solution for reducing malnutrition is most cost-effective."

Patterns (6.5.A)

Support for Student Answers

Research solutions for reducing poverty through resource management.

- Farm workers use soil and water to grow crops. People sell trees and animals from forests, use trees and other biomass to fuel cooking fires, and eat and sell fish from fisheries.
- Resource management is related to poverty because many people rely on natural resources for their livelihood. When resources are managed in a way that helps people meet their needs, poverty in an area may be reduced.
- Resource management strategies can help reduce poverty by involving local communities in the management of natural resources and the development of economic policies related to their natural resources. The income poorer communities receive from their natural resources can be increased through tourism or "buy local" initiatives, increasing the productivity of agricultural land, or paying communities to retain areas in their natural states to preserve ecosystem services."

Original Text: "Describing Greenhouse Gas Emissions in the United States

1. What was the total amount of greenhouse gases emitted by the United States in the latest year for which these data are available?

Sample answer: The total U.S. greenhouse gas emissions in 2020 was 5,982 million metric tons of CO₂ equivalent.

2. What are the major sources of greenhouse gas emissions in the United States?

Sample answer: The major sectors of greenhouse gas emissions are transportation, electric power generation, and industry.

3. What percentage of our country's emissions come from the burning of fossil fuels?

Sample answer: 92% of U.S. greenhouse gas emissions result from burning fossil fuels."

Current Page Number(s): p. 492

Location: second column, collaborate

Original Text: "COLLABORATE: Work with a partner or small group to research landfills and any patterns related to solid waste and landfills in your state or country. Develop a presentation about landfills to educate your community about what happens to their solid waste. Be creative! Your presentation can be in the form of writing, drawing, or an oral presentation.

Look for: Student presentations should include a description of what a landfill is and how it operates. They should include the process of what happens, from disposing of their solid waste through it entering the landfill. Students may mention that it is important to conserve materials because of the effects of solid waste building up in landfills."

Updated Text: "COLLABORATE: Work with a partner or small group to research solutions for reducing solid waste disposal and landfill use in your state or country.

- What sources did you find during your research? How did you know they are credible?
- Describe three current solutions for reducing solid waste disposal.
- Describe at least one solution for reducing solid waste disposal that is not widespread now but may be in the future.
- Evaluate the solutions you described for cost-effectiveness. This is the relationship between how well a solution works and how much it costs.
- Which solution is the most cost-effective way to reduce solid waste disposal?

First, orally communicate your solution to another group. Then present your solution to your class in the form of a drawing, poster, or digital slide show. Work with your teacher or other member of your community to implement your solution.

Look for: Student presentations should include an explanation of the solution they feel is the most cost-effective way to reduce solid waste disposal. Students should use evidence and supporting materials to illustrate why they support this

solution. Students may mention that it is important to conserve materials because of the effects of solid waste building up in landfills.

Location: Column 1, Differentiation: Challenge

Original Text: "Challenge students to identify scientific theories that have been dismissed by the public because they are "just theories." For example, Galileo proposed the theory that Earth revolved around the sun, but it was dismissed by people who wanted to believe Earth was the center of the universe. Plate tectonics, handwashing, germ theory, and evolution are other theories that were dismissed. Ask students to research and explain why these scientific theories were eventually accepted."

Updated Text: "Scientists use the word theory to mean a system of ideas supported by scientific testing that explains phenomena. But in nonscientific usage, theory has a less-rigorous meaning that is similar to the meaning of the word idea. For example, someone might say, "I have a theory that my dog can read—it chews up only boxes that are addressed to me." That person is using theory more to mean idea than to mean scientific theory. The theory is not supported by controlled testing and substantial evidence. On the other hand, plate tectonics, handwashing, germ theory, and evolution are examples of scientific theories because they are supported by an abundance of scientific evidence gathered by many scientists over many years. Challenge students to select a scientific theory of interest and research some of the evidence that supports it."

Location: Omission: Assessment Opportunities: Throughout the lessons, teachers are provided "Assessment Opportunities". In this section, the lesson explains to teachers what to do if students don't understand the content. For example, in Lesson 2 Day 2 of Unit 6.1, the Assessment Opportunity explains that if student's don't have the prior 4th grade knowledge of light bouncing off objects, then do not continue with the building prerequisite understanding discussion. Instead they are redirected to Building Prerequisite Understanding. These alternate activities are provided in most lessons to support teachers in recognizing barriers to student's conceptual development

Page 1796 of 3538

Original Text: Launch the Anchoring Phenomenon

Students watch a video that shows what happens to pizza as it is baked in an oven. Throughout the Topic, students will gain knowledge that should help them explain the physical and chemical changes that occur as the dough and other ingredients become a pizza.

Updated Text: Launch the Anchoring Phenomenon

Students watch a video that shows what happens to pizza as it is baked in an oven. Throughout the Topic, students will compare the states of matter in terms of structure and shape in order to analyze physical changes of the pizza ingredients. Students will also identify the formation of a new substance as evidenced by chemical changes. By investigating indicators of physical and chemical changes throughout the topic, students will understand how dough and other ingredients can be combined physically, then baked and changed chemically in order to become a pizza.

Original Text: N/A

Updated Text: (Anno) Magnetism is a non-contact force. This means that objects do not have to be touching for the force to act on them. When the refrigerator door is cracked open, it will close on its own because the non-contact force of magnetism attracts the door to the refrigerator. The strength of the magnet in the door and the distance between the magnets in the door and the refrigerator influence the strength of the magnetic force.

Updated Text: Make Informed Decisions Are rechargeable batteries a better alternative to disposable batteries?

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 90

Location: Launch the Anchoring Phenomenon

Original Text: Students watch a video that introduces the phenomenon of a bouncing rubber ball. Throughout the Topic, students will gain knowledge that should help them compare and contrast kinetic energy and potential energy. In addition, they will be able to explain that the ball's kinetic energy is converted into elastic potential energy when the ball hits the ground. This elastic potential energy is converted back into kinetic energy as the ball moves back up in the air after bouncing.

Updated Text: Students watch a video that introduces the phenomenon of a bouncing rubber ball. Throughout the Topic, students will gain knowledge that should help them compare and contrast kinetic energy and potential energy. Students

will analyze how energy is conserved through transformations and be able to explain that the ball's kinetic energy is converted into elastic potential energy when the ball hits the ground. Students will describe how elastic potential energy is converted back into kinetic energy within the model of the ball moving back up in the air after bouncing.

Original Text: They will revise this model at the end of the Experience after they gather new information and evidence.

Updated Text: They will revise this model at the end of the Explain after they gather new information and evidence.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 102

Location: Objectives

Original Text: Students will compare and contrast elastic and chemical potential energy with other forms of energy.

Updated Text: Students will compare and contrast elastic and chemical potential energy with other forms of energy. Students will plan and conduct investigations to identify and investigate cause and effect relationships.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 104

Location: Everyday Phenomenon Activity

Original Text: They will revise this model throughout the Topic as they gather new information and evidence.

Updated Text: They will revise this model at the end of Explain as they gather new information and evidence.

Proclamation 2024: Report of Editorial Changes (11/08/2023)

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 112

Location: Objectives

Original Text: Students will analyze how energy is transferred through transverse and longitudinal waves.

Updated Text: Students will analyze and explain how energy is transferred through systems as transverse and longitudinal waves by developing models and explanations.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 114

Location: Everyday Phenomenon Activity

Original Text: They will revise their explanations and models throughout the Topic as they gather new information and evidence.

Updated Text: They will revise their explanations and models throughout the Experience as they gather new information and evidence.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 115

Location: bottom of page

Original Text: N/A

Updated Text: SPECIAL NEEDS Organization Support

Students who struggle with organization may benefit from being given multistep tasks, rather than just given the materials, and asked to develop the investigation with their groups.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 122

Location: Objectives

Original Text: Students will describe how energy is conserved through transfers and transformations in systems.

Updated Text: Students will describe how energy is conserved through transfers and transformations in systems. Students will collect qualitative data to support their explanations of how energy flows through systems and is conserved.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 124

Location: Everyday Phenomenon Activity

Original Text: They will revisit their choice of explanations throughout the Topic as they gather new information and evidence.

Updated Text: They will revisit their choice of explanations at the end of Explain as they gather new information and evidence.

Updated Text: Make Informed Decisions Are pesticides safe to use in your garden? p. 310

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 280

Location: Launch the Anchoring Phenomenon

Original Text: Students watch a video that introduces the phenomenon of bear populations competing for resources. These bears, like all living things, need food, water, shelter, and space to survive. Throughout the Topic, students will gain knowledge that should help them make and use observations to predict which bear variation would be more likely to increase in number in this region.

Updated Text: Students watch a video that introduces the phenomenon of bear populations competing for resources. These bears, like all living things, need food, water, shelter, and space to survive. Throughout the Topic, students will gain knowledge that should help them describe and investigate the organization and relationships in ecosystems and describe how variations can be an advantage or disadvantage. In addition, they will also be able to make and use observations to predict which bear variation would be more likely to increase in number in this region.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 282

Location: Objectives

Original Text: Students will describe the hierarchical organization of an ecosystem in increasingly specific levels from community, to population, to organism.

Updated Text: • Students will describe the hierarchical organization of an ecosystem in increasingly specific levels from community, to population, to organism.

- Students will model the parts of an ecosystem and identify patterns to develop an explanation of its hierarchical organization.

Component: *Grade 6 Teacher Guide*

SPECIAL NEEDS Collaboration Support

Students who struggle working in a group may benefit from having set expectations and roles for each member of the group. This allows each student in the group to know their personal expectations and facilitates collaboration within the group.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 312

Location: Objectives

Original Text: Students will describe how variations within a population can be an advantage or disadvantage when it comes to survival in a changing environment.

Updated Text: • Students will model how variations within a population can be an advantage or disadvantage when it comes to survival in a changing environment.

- Students will analyze and explain how a variation in an organism is related to its ability to survive and how this relationship impacts stability and change.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 314

Location: Everyday Phenomenon Activity

Original Text: Students view the video and use the Claim-Evidence-Reasoning framework to explain how they think claw size affects fiddler crab populations as the environment changes. Remind students that when they first answer the questions, they are not expected to know the correct answer. They should use the evidence in the image and prior knowledge to consider the phenomenon.

Updated Text: Students view the video and develop explanations to show how they think claw size affects fiddler crab populations as the environment changes. Remind students that when they first answer the questions, they are not expected to know the correct answer. They should use the evidence in the video and prior knowledge to consider the phenomenon.

Location: Preview the Topic, second paragraph

Original Text: Students learned about properties of matter, physical and chemical changes, and density in Topic 3. They will build on this knowledge as they learn about the properties of Earth's layers and the rock cycle.

Updated Text: Students learned about properties of matter, physical and chemical changes, and density in Topic 1 (TEKS 6.6B and 6.6D). They will build on this knowledge as they learn about the properties of Earth's layers and the rock cycle.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 166

Location: Launch the Anchoring Phenomenon

Original Text: Students watch a video that introduces the phenomenon of lava erupting from a volcano. Throughout the Topic, students will gain knowledge that should help them explain that lava is magma, or molten rock, that has melted in Earth's mantle as part of the rock cycle in the geosphere and reaches Earth's surface during a volcanic eruption.

Updated Text: Students watch a video that introduces the phenomenon of lava erupting from a volcano. Throughout the Topic, students will plan and conduct investigations and develop models to explain how matter is conserved and cycles through Earth's systems, and students will develop explanations and describe how lava is magma, or molten rock, that has melted in Earth's mantle as part of the rock cycle in the geosphere and reaches Earth's surface during a volcanic eruption.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 168

Location: Blue Objective box

Original Text: Objective

- Students will differentiate among Earth's biosphere, hydrosphere, atmosphere, and geosphere and identify the components of each sphere.

Updated Text: Objective

Students will model the Earth's biosphere, hydrosphere, atmosphere, and geosphere to differentiate among each component and identify the interdependence of each within the function of the Earth system.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 170

Location: Everyday Phenomenon Activity, second to last sentence

Original Text: They will revisit their explanation later in the Experience as they gather new information and evidence.

Updated Text: They will revisit their explanation at the end of Explain.

Updated Text: Differentiated Instruction

SPECIAL NEEDS Accommodations Students who struggle with organization may benefit from having fewer questions on a page and from not having to complete all the questions at one time. For example, this may involve giving photocopies of only one section at a time and waiting until one section has been answered before giving the next section to the student.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 175

Location: Exit Ticket

Original Text: As an alternative exit ticket, ask students the following questions:

1. Everything on Earth is classified into four main systems. What are they? (atmosphere, biosphere, geosphere, hydrosphere)
2. Which component is part of two spheres? (Water vapor in the air is both a component of the hydrosphere, because it is water, and the atmosphere, because water vapor is a gas that makes up the atmosphere.)
3. What are some examples of spheres interacting with each other? (Humans, part of the biosphere, use rocks, part of the geosphere, to make concrete which they then use to build dams, which affect the flow of water, part of the hydrosphere. Storms, which occur in the atmosphere, can cause heavy rains, part of the hydrosphere, which can cause landslides, geosphere.)

Updated Text: Alternative Exit Ticket Give two examples of different spheres interacting with each other. (Sample answers: Beavers [biosphere] building dams that affect the flow of water [hydrosphere]. Storms form in the atmosphere and produce rain [hydrosphere].)

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 176

Location: Blue Objective box

Original Text: Objective

- Students will describe Earth's four layers.

Updated Text: Objectives

- Students will model and describe Earth's four layers.
- Students will analyze data to identify patterns in the density of materials that make up the Earth's layers to explain how it relates to the organization of the Earth's interior.

Component: *Grade 6 Teacher Guide*

ISBN: 9781418398651

Current Page Number(s): 180

Location: Everyday Phenomenon Activity, first paragraph

Original Text: You will find an editable/printable version of this activity online and also in the Experience Science Activity Companion. Students develop a model to explain why the hot springs are hot. They use prior knowledge, personal experiences, and observations from the Anchoring Phenomenon Photo as preliminary evidence. Remind students that when they initially draw their models, they are not expected to know the correct answer. They will revise this model throughout the Topic as they gather new information and evidence.

Updated Text: You will find an editable/printable version of this activity online and also in the Experience Science Activity Companion. Students develop a model to explain why the hot springs are hot. They use prior knowledge, personal experiences, and observations from the Everyday Phenomenon Photo as preliminary evidence. Current Page Number(s): 185

Location: Exit Ticket

Original Text: As an alternative exit ticket, ask students the following questions:

1. Suppose we had an instrument that could explore all layers of Earth. The probe is descending, moving down, from Earth's crust to the inner core. What sort of changes in density would the probe detect going from one layer to the next? (The probe would detect increasing density.)
